Exploring the Potential for Clean Energy

Infrastructure investments in clean energy can create exciting environmental, social and economic benefits that make a real difference in the way we relate to energy today and for our future generations.

The first step in considering the development of a clean energy project is to conduct a detailed exploration and measurement campaign on the resources available.

Beginning August 24th a meteorological tower will be installed just outside Rankin Inlet. This tower will be used to accurately measure the local resource and the true potential for producing clean energy from wind or solar power.
