## 1 INTRODUCTION

WSP Canada Inc. (WSP) was retained by B2Gold Back River Corp. (B2Gold Nunavut) to implement a vegetation monitoring program designed to quantify the potential impacts on vegetation at the Back River Project (the Project).

### 1.1 Background

The Vegetation Monitoring Plan (VMP or Plan; Sabina 2020) outlines the approach for monitoring Project-related vegetation impacts throughout the Project life. The Plan has been developed following the requirements of the Nunavut Impact Review Board (NIRB) to B2Gold Nunavut (NIRB 2013) and to address the terms and conditions outlined in Project Certificate No. 007 (prior to the July 2024 amendment), as well as any commitments made by B2Gold Nunavut throughout the regulatory review process. Five monitoring components of the VMP are outlined in Table 1. The vegetation monitoring conducted in 2024 represents the fifth year of implementation of the VMP since it was updated in January 2020.

**Table 1: Vegetation Monitoring Plan Components**

| Monitoring Component        | Description   | Monitoring Schedule/Frequency                         | Years Completed        | Comments   |
|-----------------------------|---|---|------------------------|--|
| Footprint Monitoring        | Spatial comparison of the previous footprint to the current year's footprint<br>Cumulative vegetation loss will be quantified by ecosystem type | Annually, during construction and Operation           | 2020 - 2024            | Reported in NIRB Annual reports                                      |
| WIR Monitoring              | Assessment of paired vegetation monitoring plots along WIR  | Every three years, during construction and operations | 2018, 2019, 2020, 2022 | Plots were added/established as the alignment of winter road changed |
|                             | Photographic monitoring   | Annually  | 2019, 2022, 2023, 2024 | Photographs only taken on years the WIR was constructed              |
| Vegetation Monitoring       | Permanent monitoring plots (PMPs) assessed at distance gradients from the PDA   | Every three years, during construction and operations | 2021, 2024             | Reported in this report  |
| Non-Native Plant Monitoring | Focused surveys around Goose and MLA sites  |   |                        |  |
| Lichen Monitoring           | Sampling sites in alignment with vegetation PMPs  |   |                        |  |

NIRB = Nunavut Impact Review Board; WIR = winter ice road; PMP = permanent monitoring plot; PDA = Potential Development Area; MLA = Marine Laydown Area.

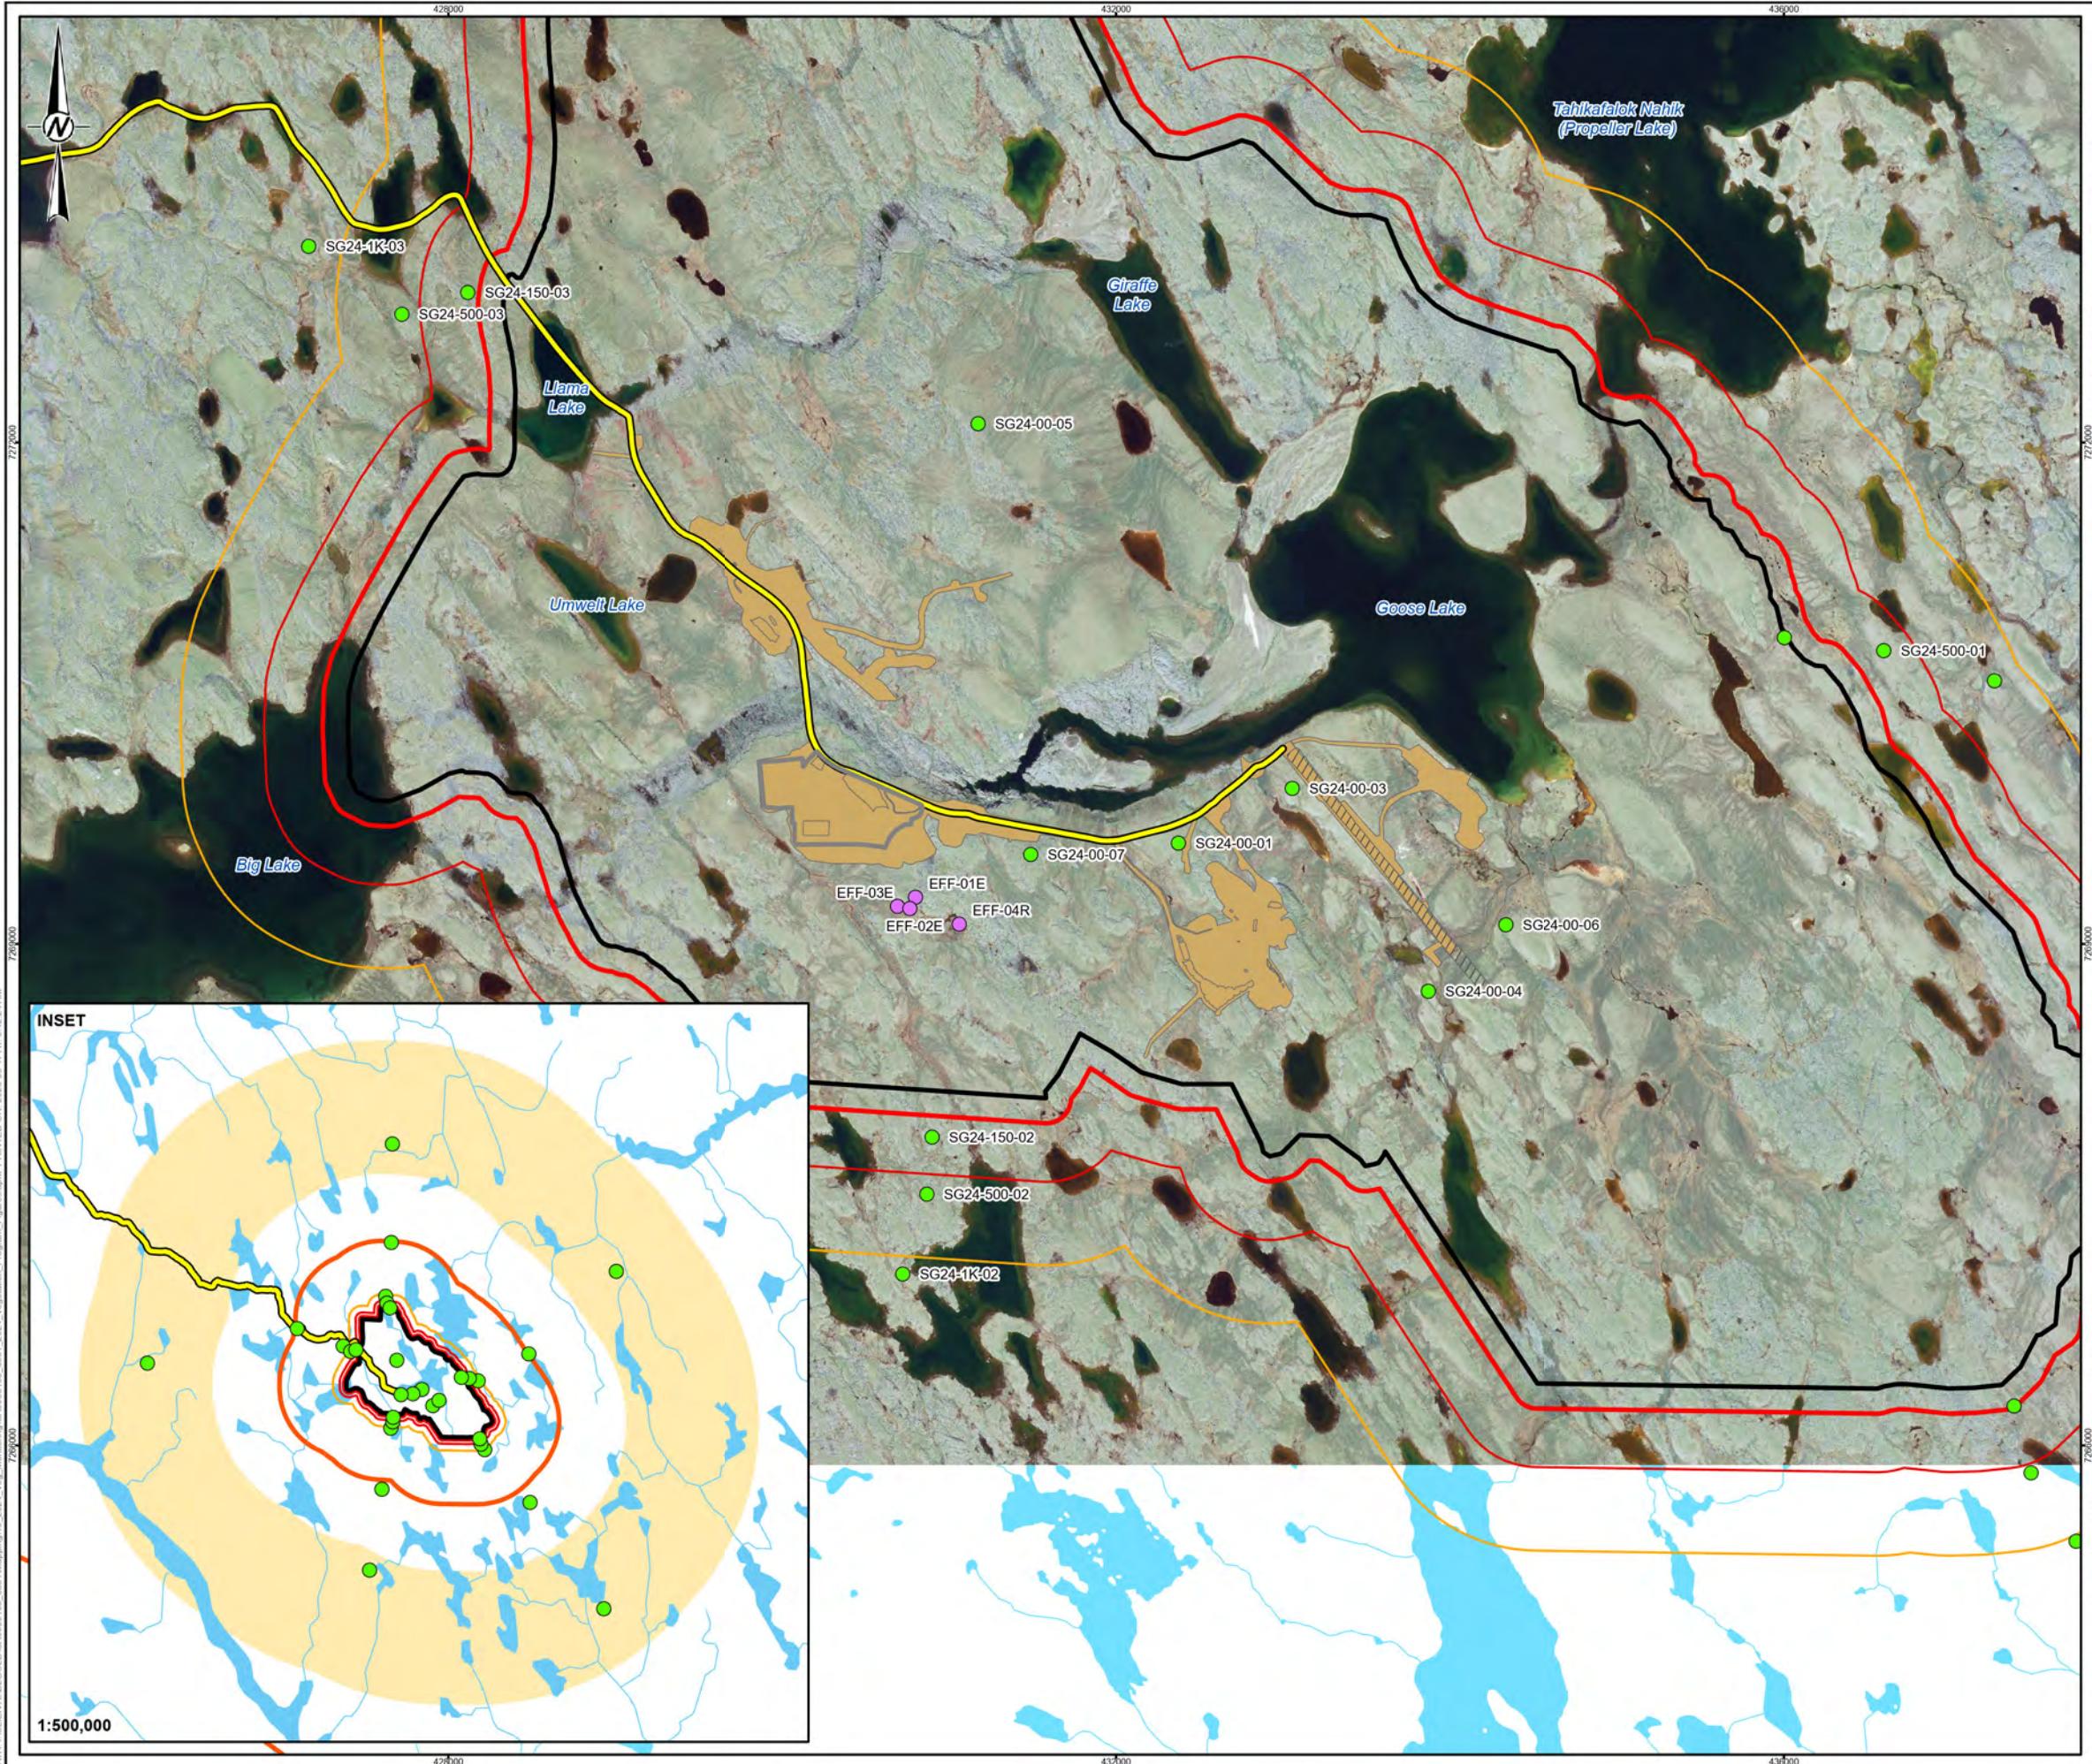

Vegetation monitoring includes monitoring vascular and non-vascular species abundance, richness (diversity), and vigour (health). This has been conducted through the establishment of fixed areas and permanent monitoring plots in dominant vegetation associations within the Local Study Area (LSA) and Regional Study Area (RSA). Lichen monitoring coincides with the vegetation monitoring locations, collecting samples for baseline metal analysis. The lichen monitoring locations were aligned with the Air Quality Monitoring and Management Plan (AQMMP) sampling locations to capture potential dust deposition effects from the mine's operations on lichen tissue. The Environmental Impact Statement (EIS) for the mine determined that winds are predominantly from the south during the growing season (Sabina 2015, Volume 4) and was used to guide where permanent vegetation monitoring plots were established. Winter ice road (WIR) monitoring also took place in 2024 in the form of annual photographic monitoring.

## 2 STUDY AREA AND MONITORING LOCATIONS

The Project lies in western Nunavut in the West Kitikmeot Region within the continuous permafrost zone of the continental Canadian Arctic. The Project is composed of two main areas: the Goose Property Area and the Marine Laydown Area (MLA), with a WIR connecting the two (Figures 1, 2 and 3, respectively). The MLA is located on the western shore of Southern Bathurst Inlet, approximately 130 kilometres (km) north of the Goose Property. A WIR is used to transport supplies between the MLA and Goose Property during the winter months.

Since a formal system of ecosystem classification does not exist for the Canadian Arctic, a preliminary classification system developed by Rescan (2013) for the Project Baseline was used for ecosite classification. This system involved incorporating data from other studies with previously developed site level ecosystem classification systems to delineate mappable ecological units with consistent vegetation associations, soil properties, and subject to a similar climate.

Broad ecosystem classes in the Project area include tundra, freshwater, marine, wetland, bedrock, riparian, and esker. Wetland/riparian ecosystems were defined according to MacKenzie and Moran (2004), and tundra was defined according to EBA (2002). Brief definitions and key characteristics of these ecosystem classes and specific vegetation associations are presented in the Back River Project: 2012 Ecosystems and Vegetation Baseline Report (Rescan 2013).

### 3 VEGETATION MONITORING PROGRAM OBJECTIVES

The main objectives of the vegetation monitoring program are:

- to measure plant species abundance (percent cover), diversity (richness), and health at vegetation plots along the WIR, MLA and Goose site
- to measure direct loss and indirect effects to plant communities as a result of the construction and operations of the WIR
- to measure the distribution and abundance of non-native plant species
- to monitor and evaluate the effectiveness of mitigation measures
- to provide an early warning of undesirable environmental changes and inform adaptive management strategies

The vegetation monitoring program consists of five main components:

- footprint monitoring
- WIR monitoring
- vegetation monitoring
- non-native plant monitoring
- lichen monitoring

Based on the monitoring schedule outlined in the VMP, the vegetation monitoring program completed in 2024 consisted of vegetation monitoring, non-native plant monitoring and lichen monitoring components, and annual photographic monitoring of the WIR.

WSP also conducted an ad-hoc assessment of vegetation health in an effluent area near the main plant where water was being discharged.

### 4 METHODS

Plot locations were selected in alignment with AQMMP sampling locations to capture potential dust deposition effects on vegetation. The gradient design is designed to capture Zone of Influences (ZOI) from dust on vegetation with increasing distance from the Project. Sampling locations were established along a distance gradient away from each Potential Development Area (PDA) boundary to allow evaluation of results relative to distance from Project activities and coincide with vegetation monitoring locations. Distances for sampling locations aligned with AQMMP sampling locations to capture potential effects of the Project's operations on lichen tissue and will include distances in the AQMMP and vegetation monitoring component:

- 0 m from the Goose Project Area
- 150 m from the Goose Project Area
- 500 m from the Goose Project Area
- 1 km from the Goose Project Area
- 5 km from the Goose Project Area

- 10 to 20 km from the Goose Project Area
- 0 m from the MLA
- 150 m from the MLA

Data collection at the vegetation monitoring plots was completed from July 3 to 10, 2024. A total of 40 vegetation monitoring plots have been previously established (31 on the Goose Property, 9 in the Marine Laydown Area) with distances from the PDA aligning with the AQMMP. One plot at the Goose Property and one at MLA had been lost due to development and had to be reestablished with a plot nearby. Both vegetation monitoring and lichen sampling were conducted at these plots. The location and vegetation class of these plots are presented in Table 2, Figure 1 and Figure 2.

**Table 2: Summary of Vegetation Monitoring Plots Assessed in 2024**

| Project Component   | Distance from PDA Boundary | Number of Plots |
|---------------------|----------------------------|-----------------|
| Goose Project Area  | 0 m                        | 6               |
|                     | 150 m                      | 5               |
|                     | 500 m                      | 5               |
|                     | 1 km                       | 5               |

## 4.1 Vegetation Monitoring

To capture the potential effects of the Project's operations, vegetation monitoring plots were established in 2021 and revisited in 2024. The plots were established in cardinal directions surrounding the Project components in the dominant vegetation associations - mesic dwarf tundra and dry sparse tundra (Table 3). In 2021, many plots classified as undifferentiated tundra were recategorized into the correct vegetation associations in 2024.

**Table 3: Distribution of Vegetation Monitoring Plots by Vegetation Association**

| Project Component   | Vegetation Association  | Number of Monitoring Plots |
|---------------------|-------------------------|----------------------------|
| Goose Project       | Dry Sparse Tundra (TH)  | 29                         |
|                     | Mesic Dwarf Tundra (TL) | 2                          |
| Marine Laydown Area | Dry Sparse Tundra (TH)  | 5                          |
|                     | Mesic Dwarf Tundra (TL) | 4                          |

Monitoring was conducted during the peak flowering period for most species when fruiting structures were likely to be present to allow for accurate identification, consistent with the 2021 monitoring also conducted in early July. The vegetation dataset is limited to those species with pronounced fruiting structures (and characteristics) present in early summer (i.e., early July), which allowed for their identification.

The monitoring plots were assessed by a vegetation ecologist and included plant species present by vegetation strata layer, ground cover, detailed site information and vegetation association data. The plots were one square meter in size, and plot corners were identified with labelled metal tags or markers to be identifiable in future sampling events. Information collected at each site included:

- plant species composition (richness) and relative abundance (relative mean plant species percent cover) of vascular plant and non-vascular species
- average heights of plant species observed
- vigour class or overall plant health of vascular plant species
- relative abundance (percent cover) of surface substrate materials
- dominant structural stage, moisture regime, and nutrient regime
- wildlife sign (e.g., fecal pellets, browsing/grazing, beds, digging) observations, if present

Other recorded plot attributes included the dominant structural stage, moisture regime, and nutrient regime. The structural stage describes the existing dominant vegetation strata structure (e.g., dominated by lichen, bryophyte, forb, etc.). Moisture and nutrient regimes signify the relative moisture and nutrient supply available in the soil to vegetation and are limiting factors in vegetation growth. The plant species present and soil information are used to estimate moisture and nutrient regimes.

Total vegetation abundance inclusive of all vegetation layers could add to more than 100% due to overlap in the layers (e.g., shrub layer, forb layer, graminoid layer); however, within a vegetation layer, abundance cannot add to more than 100%. Relative abundance (percent cover) of each vegetation layer was recorded for each plot, including:

- shrubs
- forbs
- graminoids (grasses and sedges)
- bryophytes (mosses, liverworts and hornworts)
- lichens

Percent cover of surface substrate materials (adding to 100%) was recorded within each plot, including:

- live vegetation
- exposed mineral soil/bare ground
- bedrock
- cobbles and stones
- water

- decaying wood
- animal pellets
- litter

Qualitative analytical approaches were completed using an *in-situ* vigour class scale to evaluate overall plant health. Vigour classes closely follow the Ecological Land Survey Site Description Manual (AEP 1994), as follows:

- 0 = very poor (>50% leaves necrotic)
- 1 = poor (31 to 50% leaves necrotic)
- 2 = fair (16 to 30% leaves necrotic)
- 3 = good (6 to 15% leaves necrotic)
- 4 = very good (0 to 5% leaves necrotic)

A similar qualitative approach was also used to assign a disturbance class to each WIR monitoring plot as follows:

- NA = No visible damage
- Low = 0 to 25% vegetation in plot necrotic/damaged
- Moderate = 26 to 50% of the vegetation in the plot necrotic/damaged
- High = 51 to 75% of the vegetation in the plot necrotic/damaged
- Very High = >75% of vegetation in the plot necrotic/damaged, nearly no living vegetation

WIR plots with documented disturbance classes other than NA were considered impacted. Digital photographs were taken from the south side of each plot and facing north. A summary of plots by Project component and vegetative characteristics is provided in Table 3.

#### **4.1.1 Treated Wastewater Effluent Release Area**

In addition to the general vegetation monitoring plots, four additional plots were established in 2024 in an area where treated wastewater effluent was being released on native vegetation within the Goose Property. Three plots were established in exposure (affected) areas and one in a nearby reference (unaffected) area. These plots aim to monitor if there are effects from the treated effluent discharge on vegetation.

#### **4.2 Non-Native Plant Monitoring**

The Government of Nunavut (GN) and Environment and Climate Change Canada (ECCC) define a non-native species as 'an organism that is not normally found in a region' (CESCC 2010). The Canadian Endangered Species Conservation Council (CESCC) identified 17 non-native plant species not normally found in Nunavut with a potential for becoming established, 14 of which are vascular (non-native) plants to the region (CESCC 2010). To minimize the potential introduction of non-native plants, B2Gold Nunavut has established cleaning requirements for the transport of goods to the site by air or water. The requirements include the inspection and removal of any debris from any inbound equipment and bulk goods prior to transport, as well as on arrival at the site.

Under the VMP, non-native plant species monitoring is to occur during Construction and Operation Phases of the Project, until Closure. Monitoring will be conducted within the Goose Property, MLA, WIR footprint and adjacent habitats to ensure non-native plant species are not introduced to the Arctic environment. This monitoring was conducted by surveillance of the footprint and adjacent habitat during the vegetation monitoring surveys between July 3 and July 10, 2024, similar to how the monitoring was conducted in 2021.

## 4.3 Lichen Monitoring

The Project is expected to create fugitive dust through various sources, primarily by blasting and crushing rock, and road construction and traffic. As part of the AQMMP, dustfall monitoring occurred during the summer months in experimental and control areas to determine the level of dust deposition associated with the Project (Goose Property and MLA). Additional details of this sampling can be found within the AQMMP (Sabina 2019).

Under the VMP, dustfall impacts were monitored through the evaluation of lichen tissue metal concentrations. A subset of the vegetation monitoring plots outside the footprint and representing a range of distances from Project activities were selected for lichen tissue metal sampling. This sampling was conducted adjacent to the vegetation monitoring plots so as not to alter vegetation composition within the permanent plot itself but also to provide complementary information for both monitoring programs.

The prevailing winds are predominantly southerly during the foliage season for both the Goose Property and MLA (Sabina 2015, Volume 4, Figures 3.1-6 and 3.1-7). The distance gradient was designed in conjunction with the AQMMP, in consideration of the Project footprint and dominant wind direction. Lichen sampling was conducted in close association with vegetation monitoring locations, with actual sampling locations lying outside of monitoring plots. Collected lichen samples were sent to ALS Laboratories for metals analysis.

The lichen sampling program intends to report on baseline levels of metals in lichen potentially affected by the Project. To evaluate the potential for adverse health effects to terrestrial life associated with changes in environmental quality due to chemical releases from the Project, the existing (or baseline) conditions of the environment must first be understood. Lichen species were chosen because they are estimated to account for 87 to 90% of the diet for caribou (Thomas 1998). Lichen can also effectively and preferentially bioaccumulate airborne contaminants because of their lack of roots, large surface area, long life span, and high ion exchange capacity (Naeth and Wilkinson 2006). This allows lichens to provide “worst-case” exposure concentrations for assessment of risks to caribou. Locations of the lichen sampling are provided in Table 4.

**Table 4: Lichen Sampling Locations**

| Project Location | Distance from PDA | Plot Number               | Location (13W) |          |
|------------------|-------------------|---------------------------|----------------|----------|
|                  |                   |                           | Easting        | Northing |
| Goose Project    | 0 m               | SG24-00-01                | 432371         | 7269602  |

(a) A plot was newly established in 2024 to replace plots lost due to project-related disturbance.

Lichen sampling was conducted concurrently with the vegetation monitoring program from July 3 to July 10, 2024. For each sample location, species of lichen collected, weather conditions at the time of sampling, and surface substrate percentages were recorded.

### 4.3.1 Field Protocols

Clean sampling protocols were implemented so that samples were not contaminated by external sources following the same procedures employed for the 2021 lichen monitoring (Golder 2022). Powderless nitrile gloves were used for all contact with lichens. Titanium scissors were used to snip the upper leafy portion from several plants within the same location at each sample site to create a composite sample. Samples were collected in Ziploc bags and kept cool until they could be frozen and transported to the laboratory for analysis. All tools used in sampling were cleaned between sites by washing with detergent and rinsing with distilled water. New nitrile gloves were used at each sample plot.

Lichen samples were not washed or otherwise cleaned of dust and soil prior to analysis. A cleaning step was not considered appropriate given that the purpose of the lichen monitoring program was to assess dust deposition on lichen and its associated effects on caribou health. Caribou are also known to inadvertently ingest dust and soil while foraging.

Field duplicates of lichen were collected to assess the variability in results within a sampling location. Eight lichen duplicate samples were collected, with one sample collected from a plot within each distance gradient from the PDA. At each location where the duplicate was collected, the lichen sample was gently mixed to form a composite and then split into two separate samples for metals analysis.

### 4.3.2 Laboratory Analysis

Lichen samples were analyzed by ALS Environmental (ALS), Burnaby, British Columbia. Lichen samples were analyzed for total mercury by cold vapour atomic fluorescence spectrophotometry (CVAFS), total metals by collision/reaction cell inductively coupled plasma mass spectrometry (CRC ICP-MS), and percent moisture. The analyzed metals included aluminum, antimony, arsenic, barium, beryllium, bismuth, boron, cadmium, calcium, cesium, chromium, cobalt, copper, iron, lead, lithium, magnesium, manganese, mercury, molybdenum, nickel, phosphorus, potassium, rubidium, selenium, sodium, strontium, tellurium, thallium, tin, uranium, vanadium, zinc, and zirconium.

### 4.3.3 Quality Assurance and Quality Control

Quality assurance and quality control practices were followed to confirm that the chemistry data collected are representative, of known data quality, properly documented and are scientifically defensible.

Quality assurance procedures for field operations involved field crew training, pre-field meetings, use of standardized methods, and providing clear instructions for collecting and handling field data. Quality control procedures implemented during field operations included the collection of duplicate samples to evaluate sample heterogeneity. The results obtained from the duplicate samples were used to calculate the relative percent difference (RPD) for each parameter. A lower RPD indicates higher sample homogeneity. An RPD was considered notable when it was 40% or greater and both samples had concentrations greater than five times the detection limit. This second criterion takes into account the potential for data accuracy error when parameter concentrations approach detection limits. Relative percent difference was calculated from the following formula:

$$RPD = \left( \frac{|sample - duplicate|}{mean} \right) \times 100$$

Quality assurance procedures for laboratory operations included submitting the lichen samples to a laboratory accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA) for the analytical suite for this Project. To receive accreditation, a laboratory must pass an evaluation of its internal procedures, analytical methods, and quality assurance and quality control processes. Parameters were analyzed by the laboratory using standard methods published by internationally recognized agencies, such as the United States Environmental Protection Agency. Quality control procedures for laboratory operations included the analysis of laboratory quality control samples including method blanks, laboratory control samples, laboratory duplicates, and reference materials.

#### **4.3.4 Data Analysis**

Metals concentrations in lichen collected were tabulated, and summary statistics were calculated for each area (e.g., mean, standard deviation, standard error, minimum and maximum concentrations). One-half the detection limit (DL) was substituted for non-detect values in the dataset. Mean concentrations of parameters measured in lichen were compared graphically to baseline concentrations (Intrinsik 2015)<sup>1</sup> and concentrations measured at the Back River Project in 2021 (Golder 2022) to determine how metal concentrations have changed over time and from the distance from the PDA.

### **4.4 Winter Ice Road Photographic Monitoring**

Annual photographic monitoring of the previously established WIR vegetation monitoring plots was conducted at 44 previously established monitoring locations along the WIR route on July 8, 2024. Due to the nature of the WIR, permanent plot markers are difficult to maintain; therefore, some plots may have been adjusted slightly due to limited GPS accuracy. Photographs were taken from the south side of the plot facing north. The monitoring locations are those that are currently on the WIR alignment and are expected to remain on the WIR alignment in future years. A quantitative approach to assign a disturbance class to each plot was used as follows:

- NA = No visible damage
- Low = 0 to 25% vegetation in plot necrotic/damaged
- Moderate = 26 to 50% of the vegetation in the plot necrotic/damaged
- High = 51 to 75% of the vegetation in the plot necrotic/damaged
- Very High = >75% of the vegetation in the plot necrotic/damaged, nearly no living vegetation

The disturbance classes allow for comparison between years and to document trends in changes to vegetation along the WIR.

---

<sup>1</sup> Lichen chemistry was measured for the Project in 2015 as part of the country foods baseline screening level risk assessment (Intrinsik 2015).

## 5 RESULTS

### 5.1 Vegetation Monitoring

The 2024 vegetation surveys were completed between July 3 and 10, 2024, and 36 vascular plants in the Project area were identified. A total of 24 non-vascular plants (6 bryophytes and 18 lichens) were identified during 2024 field surveys. This is very similar to 2021 results where 36 vascular plants and 24 non-vascular (5 bryophytes and 19 lichens) were observed. Appendix A provides a complete list of the vascular and non-vascular species that were recorded during field surveys, including graminoid and lichen species important for wildlife forage. The most common and widespread vascular species found were alpine blueberry (*Vaccinium uliginosum*), rock cranberry (*Vaccinium vitis-idaea*), northern Labrador-tea (*Rhododendron tomentosum*), and arctic dwarf birch (*Betula nana*), which were observed respectively in 32, 35, 37 and 39 of the 40 plots surveyed. Appendix B provides representative photographs of each vegetation type observed in each Project Area. Appendix C provides detailed vegetation plot information, including plot location, date surveyed, structural stage, moisture and nutrient regimes.

Average height by vegetation strata were calculated based on vegetation association and treatment (Table 5).

**Table 5: Average Vegetation Height by Strata**

| Vegetation Type and Distance from PDA Boundary | Average Height (cm) |      |           |           |        |

| 10 to 20 km                                    | 3.5                 | -    | 10.3      | 1.0       | 2.4    |

Shrub and graminoid cover constitute the tallest vegetation strata, but the average vegetation height is under 15 cm for most vegetation types, which is consistent with results in 2021 (Appendix D). Overall average heights of shrub, graminoid, bryophyte and lichen strata appear to be similar regardless of vegetation type. Distance from the PDA and the associated potential influence of dust deposition do not appear to affect vegetation height at this time in the Project's development.

Percent cover of the surface substrate was summarized by the vegetation association present at the MLA and Goose Property for the vegetation monitoring plots (Table 6).

**Table 6: Average Surface Substrate Percentage by Vegetation Association**

| Vegetation Type and Distance from PDA Boundary | Average Surface Substrate Percentage (%) by Vegetation Association |      |            |             |         |         |        |                |
|--|--|------|------------|-------------|---------|---------|--------|----------------|
|  | Lichen   | Moss | Vegetation | Bare Ground | Bedrock | Cobbles | Litter | Animal Pellets |

PDA = Potential Development Area.

Overall, differences in surface substrate with increasing distance from the PDA appear minor and likely due to natural variability between plots. The results of surface substrate cover are similar to those observed during 2021 vegetation monitoring (Appendix D).

Species richness by distance from the PDA and by vegetation association is presented in Table 7.

**Table 7: Average Species Richness Per VMP Plot by Vegetation Type by Distance from PDA Boundary**

| Project Area and Vegetation Type | Average Species Richness |           |           |           |           |           |
|----------------------------------|--------------------------|-----------|-----------|-----------|-----------|-----------|
|                                  | 0 m                      | 150 m     | 500 m     | 1 km      | 5 km      | 10-20 km  |
| <b>Goose Property</b>            |                          |           |           |           |           |           |
| Dry Sparse Tundra (TH)           | 15.2                     | 16.4      | 15.8      | 13.8      | 14        | 15.4      |
| Mesic Dwarf Tundra (TL)          | 16                       | -         | -         | 15        | -         | -         |
| <b>Marine Laydown Area</b>       |                          |           |           |           |           |           |
| Dry Sparse Tundra (TH)           | 17.8                     | -         | -         | -         | -         | -         |
| Mesic Dwarf Tundra (TL)          | -                        | 14        | -         | -         | -         | -         |
| <b>Total Species Observed</b>    | <b>49</b>                | <b>51</b> | <b>28</b> | <b>28</b> | <b>27</b> | <b>26</b> |

Note: Totals may not equal sums as totals only consider unique species.

PDA = Potential Development Area; “-“ = no plot data.

Comparing the overall (i.e., all layers or strata present within plots) species richness at the various distances from the PDA to plots within the PDA does not reveal a pattern in species richness across the distance gradient from the Project.

At the MLA, the highest average species richness of 17.8 was observed at 0 m from the PDA, while an average of 14 species was observed at 150 m from the PDA.

At the Goose Property, the highest average species richness of 16.4 was observed at 150 m from the PDA, while the lowest of 14 species was observed at 5 km from the PDA.

When looking at the total number of species observed, the highest species diversity of 51 was observed at 150 m from the PDAs and the lowest of 26 species was observed at 10 to 20 km from the PDA at the Goose Property. Overall, the species observed are very similar to those observed in 2021 (Appendix D). The highest species richness in 2021 was 48 species observed at 0 m from the PDAs, and the lowest species richness was 24 species at 500 m from the PDA at the Goose Property.

The abundance of vascular and non-vascular plants at each distance from PDA and vegetation type is provided in Table 8.

**Table 8: Abundance of Vascular and Non-Vascular Species by Project Area, Vegetation Type and Distance from PDA Boundary, 2024**

| Vegetation Type and Distance from PDA Boundary | Abundance of Vascular and Non-Vascular Species |                  |              |                  |              |                  |              |                  |              |                  |              |                  |

| Mesic Dwarf Tundra (TL)                        | 9  | 7                | -            | -                | -            | -                | 6            | 9                | -            | -                | -            | -                |
| <b>Marine Laydown Area</b>                     |  |                  |              |                  |              |                  |              |                  |              |                  |              |                  |
| Dry Sparse Tundra (TH)                         | 25   | 12               | -            | -                | -            | -                | -            | -                | -            | -                | -            | -                |
| Mesic Dwarf Tundra (TL)                        | -  | -                | 21           | 14               | -            | -                | -            | -                | -            | -                | -            | -                |
| <b>Total</b>                                   | <b>29</b>                                      | <b>20</b>        | <b>27</b>    | <b>24</b>        | <b>12</b>    | <b>16</b>        | <b>12</b>    | <b>16</b>        | <b>12</b>    | <b>15</b>        | <b>14</b>    | <b>12</b>        |

Note: Abundance is defined by the relative mean plant species cover; PDA = Potential Development Area.

The overall findings of vascular plant richness indicate that most of the areas surveyed consist of low species richness in vascular plant communities, with species richness averaging 15 species per plot, which is the same species richness as observed in 2021 (Appendix D). The highest abundance of vascular plants (25) was seen at the vegetation plots at 0 m from the PDA at the MLA, while the highest number of non-vascular species (16) was observed at the vegetation plots at 500 m from the PDA at the Goose Property. In general, the mesic dwarf tundra vegetation types had lower species abundance than the dry sparse tundra vegetation type. These results are consistent with those results observed in 2021, with the highest number of vascular species (21) observed at 0 m from the PDA at the MLA and the highest number of non-vascular species (14) was observed at the 0 m from the PDA at the Goose Property (Appendix D).

The average vigour across species at each distance from PDA and vegetation type is presented in Table 9.

**Table 9: Average Vigour of Observed Species by Project Area, Vegetation Type and Distance from PDA Boundary**

| Vegetation Type         | Average Vigour <sup>(a)</sup> |       |       |      |      |          |
|-------------------------|-------------------------------|-------|-------|------|------|----------|
|                         | 0 m                           | 150 m | 500 m | 1 km | 5 km | 10-20 km |
| <b>Goose Property</b>   |                               |       |       |      |      |          |
| Dry Sparse Tundra (TH)  | 4                             | 3.9   | 3.9   | 3.9  | 3.9  | 3.9      |
| Mesic Dwarf Tundra (TL) | 3.8                           | -     | -     | 3.9  | -    | -        |
| <b>MLA</b>              |                               |       |       |      |      |          |
| Dry Sparse Tundra (TH)  | 4                             | -     | -     | -    | -    | -        |
| Mesic Dwarf Tundra (TL) | -                             | 3.9   | -     | -    | -    | -        |

Note:

(a) Average vigour is calculated by assessing the vigour of each species and averaging across plots based on the scale: poor = 1, fair = 2, good = 3, excellent = 4.

PDA = Potential Development Area.

The average vigour across each distance from the PDA and vegetation type was generally excellent. There was no noticeable difference in plant vigour across the distance gradients from the PDAs. These results are similar to those observed in 2021 where the average vigour ranged from 3.3 to 4.0 with no observable trends in distances from the PDAs.

### 5.1.1 Treated Effluent Release Area

Vegetation monitoring of the treated effluent release area was conducted on July 10, 2024.

Table 10 provides general information about the four established plots.

**Table 10: Treated Effluent Release Area Vegetation Monitoring Results**

| Plot Name | Plot Type | Location (13V) |          | Vegetation Type   | Average Species Vigour | Species Richness |              | Dominant Species  |
|-----------|-----------|----------------|----------|-------------------|------------------------|------------------|--------------|---|
|           |           | Easting        | Northing |                   |                        | Vascular         | Non-Vascular |   |
| EFF-01E   | Exposure  | 430800         | 7269279  | Dry-sparse tundra | 3.9                    | 7                | 7            | <i>Flavocetraria cucullata</i> ,<br><i>Flavocetraria nivalis</i> ,<br><i>Rhododendron tomentosum</i> ,<br><i>Cassiope tetragona</i> |
| EFF-02E   | Exposure  | 430768         | 7269215  | Dry-sparse tundra | 4.0                    | 10               | 12           | <i>Rhododendron tomentosum</i> ,<br><i>Empetrum nigrum</i> , <i>Vaccinium vitis-idaea</i> , <i>Andromeda polifolia</i>              |

**Table 10: Treated Effluent Release Area Vegetation Monitoring Results**

| Plot Name | Plot Type | Location (13V) |          | Vegetation Type | Average Species Vigour | Species Richness |              | Dominant Species  |
|-----------|-----------|----------------|----------|-----------------|------------------------|------------------|--------------|---|
|           |           | Easting        | Northing |                 |                        | Vascular         | Non-Vascular |   |
| EFF-03E   | Exposure  | 430692         | 7269226  | Tussock meadow  | 3.9                    | 5                | 2            | <i>Eriophorum vaginatum, Sphagnum angustifolium, Carex vaginata, Betula nana</i>          |
| EFF-04R   | Reference | 431064         | 7269118  | Tussock meadow  | 4.0                    | 5                | 2            | <i>Carex aquatilis, Andromeda polifolia, Sphagnum angustifolium, Aulacomnium turgidum</i> |

The three plots in the exposure area were either dry-sparse tundra or tussock meadow vegetation type. Although a reference plot was not established in a dry-sparse tundra vegetation type, many vegetation plots established for the VMP are in the dry-sparse tundra vegetation type and can be considered reference sites for the treated effluent affected area. The average vigour of the vegetation species in both the exposure and reference sites was excellent (Table 10). The species richness at the dry-sparse tundra exposure plots varied greatly but was consistent with the species observed at the VMP vegetation plots (Table 10). The tussock meadow vegetation type has much lower species richness however, the exposure plot is comparable to the reference plot in species richness (Table 10).

The surface substrate percent coverages for the treated effluent area plots are provided in Table 11.

**Table 11: Treated Effluent Release Area Plot Surface Substrate Percent Cover**

| Plot Name | Surface Substrate (%) |      |            |             |         |         |         |        |                |
|-----------|-----------------------|------|------------|-------------|---------|---------|---------|--------|----------------|
|           | Lichen                | Moss | Vegetation | Bare Ground | Bedrock | Bedrock | Cobbles | Litter | Animal Pellets |
| EFF-01E   | 52                    | 0    | 95         | 1           | 0       | 0       | 2       | 2      | 0              |
| EFF-02E   | 22                    | 10   | 89         | 1           | 0       | 0       | 0       | 10     | 0              |
| EFF-03E   | 0                     | 16   | 63         | 0           | 0       | 0       | 0       | 35     | 2              |
| EFF-04R   | 0                     | 14   | 55         | 0           | 3       | 3       | 0       | 42     | 0              |

There are differences in surface substrate cover between the dry-sparse tundra plots (EFF-01E and EFF-02E) and the tussock meadow plots (EFF-03E and EFF-04R). Although a reference plot was not established in a dry-sparse tundra vegetation type, many of the plots established for the VMP are in the dry-sparse tundra vegetation type and have similar surface substrate cover (Table 6). The surface substrates of the two tussock meadow plots are more similar indicating no observable difference between the exposure at reference plots currently. The surface substrates of the dry-sparse tundra plots are very similar to the dry-sparse tundra VMP plots (Table 6). There were no observable effects of the treated effluent on vegetation at the time of monitoring (Appendix B).

The average height by vegetation strata at the treated effluent plots is provided in Table 12.

**Table 12: Treated Effluent Area Plot Average Vegetation Height by Strata**

| Plot Name | Vegetation Type   | Average Vegetation Height by Strata |      |           |           |        |
|-----------|-------------------|-------------------------------------|------|-----------|-----------|--------|
|           |                   | Shrub                               | Forb | Graminoid | Bryophyte | Lichen |
| EFF-01E   | Dry-sparse tundra | 4.8                                 | 4.0  | 4.0       | -         | 2.4    |
| EFF-02E   | Dry-sparse tundra | 3.7                                 | 1.0  | 11.0      | 1.7       | 2.3    |
| EFF-03E   | Tussock meadow    | 15.0                                | -    | 24.0      | 5.5       | -      |
| EFF-04R   | Tussock meadow    | 10.0                                | -    | 25.0      | 2.5       | -      |

Shrub and graminoid cover constitute the tallest vegetation strata, but the average vegetation height is under 25 cm for each of the plots. The dry sparse tundra plots have overall shorter vegetation than the tussock meadow plots, which are dominated by graminoids

## 5.2 Non-Native Plant Monitoring

Non-native plant surveys were completed around existing infrastructure at the Goose and MLA properties and along the WIR. No non-native plants, as identified by CESCC (2010), were observed during these surveys. One individual of common yarrow (*Achillea millefolium*) was observed near the MLA camp at 13W 381038E 7394536N. A photo of this observation is provided in Appendix B. While not listed by the CESCC as an invasive plant, common yarrow is not known to exist in Nunavut (NatureServe 2024; CESCC 2022). The species is considered native in some places in North America, but some populations may be introduced (NatureServe 2024). The Flora of North America (FNA 2020) lists common yarrow as distributed across North America, including Nunavut. It is unclear if this species is considered an introduced population because information on its presence in Nunavut is limited.

## 5.3 Lichen Monitoring

Eighteen unique species of lichen were observed and sampled during the 2024 program (Appendix E). The most abundant species observed were green witches hair (*Alectoria ochroleuca*), arctic butterfingers lichen (*Dactylina arctica*), arctic pretzel lichen (*Bryocaulon divergens*), crinkled snow lichen (*Flavocetraria nivalis*), and curled snow lichen (*Flavocetraria cuculata*), which were observed in 19, 23, 25, 35, and 36 respectively of the total 39 sampling locations. There were no visible signs of dust deposition at any of the vegetation monitoring plots.

The lichen samples for chemical analysis were received by ALS in good condition and within the required holding time. The laboratory certificate of analysis and associated quality control reports are provided in Appendix F. Laboratory quality control samples of method blanks, laboratory control samples, and reference materials met data quality objectives for all parameters. The laboratory also re-analyzed some field samples and calculated RPDs between the original reported concentrations and their duplicate results; all RPDs met the laboratory data quality objective of 40% with the exception of arsenic in one sample from the set collected at 5 km from the PDA at the Goose Property. The RPD for the original concentration and the laboratory duplicate in this sample (i.e., 42%) slightly exceeded the laboratory data quality objective, which can occur due to sample heterogeneity. Table F-1 in Appendix F provides the RPDs for field duplicates. The incidence of RPDs greater than 40% was generally low in the lichen field duplicates, with the exception of the duplicates collected at 150 m and 5 km from the PDA at the Goose Property and at 150 m from the PDA at the MLA. The RPDs in these duplicate sets indicate high variability in metal concentrations within the lichen composites at these three locations.

Appendix G Figure G-1 provides the summary statistics calculated for each area (e.g., mean, standard deviation, standard error, minimum and maximum concentrations) by area (distance from PDA). Graphs comparing the 2024 concentrations to those measured in 2015 (baseline) and 2021 are provided in Figure G-1 in Appendix G.

At both the Goose Property and the MLA, the effects of Project-related dust deposition were obvious at 0 m from the PDAs, with multiple metals having concentrations in lichen higher than baseline and typically higher than 2021. However, the effects were generally limited to 0 m from the PDAs because concentrations in lichen for most metals were generally lower at 150 m from the PDAs and because concentrations at 150 m from the PDA at the Goose Property were similar to those at further distances. Metals with elevated concentrations at 0 m from the PDAs that may be Project-related included:

- at the Goose Property: aluminum, antimony, arsenic, cesium, chromium, copper, iron, lead, magnesium, manganese, molybdenum, uranium, vanadium
- at the MLA: aluminum, antimony, arsenic, barium, boron, cadmium, calcium, cesium, cobalt, copper, iron, lead, magnesium, manganese, mercury, strontium, thallium, uranium, vanadium, zinc

Most metal concentrations in lichen were close to (generally within a factor of two) or below baseline at distances at or greater than 150 m from the PDAs with a few exceptions. Mean barium, manganese, and sodium concentrations in 2024 were more than two times baseline concentrations at all distances from the PDA at Goose Property; however, obvious trends of decreasing concentrations with distance from the PDA were not observed. Mean concentrations of chromium and cobalt at 0 m and 150 from the PDA at the MLA were greater than baseline, but 2024 concentrations were similar at the two distances, which suggest that the higher concentrations were not Project-related. Mean cadmium concentration at 150 m from the PDA at the MLA were more than two times the baseline in both 2021 and 2024, with similar mean concentrations between the years, suggesting no change since 2021. Mean concentrations of molybdenum and nickel at 150 m from the PDA at MLA were more than two times higher than baseline, but were also higher than at 0 m from PDA, suggesting these concentrations were not Project-related.

For many metals, mean concentrations in lichen were higher in 2024 compared to 2021, regardless of distance from the PDAs (e.g., barium, manganese, mercury and thallium at the Goose Property, chromium at the MLA). The reason for these higher concentrations in 2024 is unknown but it is unlikely that they are Project-related given that concentrations were similar and did not decline with distance from the PDAs.

## 5.4 WIR Photographic Monitoring

The photos of the WIR monitoring plots taken in 2024 are included in Appendix H. The photos from 2019, 2022 and 2023 photographic monitoring are also included for comparison purposes. A summary of the disturbance classes assigned to each plot is provided in Table 13.

Of the 44 WIR monitoring plots, 12 have had aggregate material placed on them and should be replaced with new monitoring plots. Of the remaining 32 WIR monitoring plots, one plot is considered to have high impacts, three plots have moderate impacts, five plots have low impacts and 23 plots have no impacts from the WIR.

**Table 13: Summary of Disturbance Classes of WIR Monitoring Plots**

| Plot Name | Plot Type    | Location (13W) |          | Disturbance Class |           |          |           | Comments   |

Note: NA – No visible disturbance.

## 6 CONCLUSIONS

The 2024 vegetation monitoring program represents the second round of vegetation, non-native species and lichen monitoring following the 2020 update of the VMP and monitoring in 2021. The monitoring plots proposed in the VMP were adequately established, and monitoring for vegetation species, abundance, height and vigour was completed. Changes in species diversity and abundance because of the Project were not observed. Results of vegetation and non-native plant monitoring are comparable to results from 2021, with no noticeable differences or trends. Lichen monitoring results indicate that Project-related dust deposition resulted in higher metal concentrations in lichen at 0 m from the PDAs, but did not appear to affect metal concentrations in lichens at further distances. Metal concentrations were generally higher at all monitoring locations in 2024 than in 2021; the reason for which is unknown.

The next vegetation, non-native plant and lichen monitoring components are scheduled to occur in 2027 as per the monitoring frequency in the VMP. Footprint and photographic monitoring of the WIR will continue to occur annually.

(a) CESCC 2022

(b) NatureServe 2024

(c) Species ranks are defined as: S3: Vulnerable—At moderate risk of extirpation in the jurisdiction due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors; S4: Apparently Secure—At a fairly low risk of extirpation in the jurisdiction due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors; S5: Secure—At very low or no risk of extirpation in the jurisdiction due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats; SNR: Unranked—National or subnational conservation status not yet assessed. N/d: no data.

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key:

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

LOR: Limit of Reporting (detection limit).

| Unit      | Description                        |
|-----------|------------------------------------|
| %         | percent                            |
| mg/kg     | milligrams per kilogram            |
| mg/kg wwt | milligrams per kilogram wet weight |

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

## General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

### Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percent Difference

# = Indicates a QC result that did not meet the ALS DQO.

## Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

## Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

### Qualifiers

| Qualifier | Description   |
|-----------|---|
| DUP-H     | Duplicate results outside ALS DQO, due to sample heterogeneity. |

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: Biota

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

## Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

---

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

**Key**

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

---

### Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

---

### Summary of Outliers

#### Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- Duplicate outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

#### Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

#### Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

## ***Outliers : Frequency of Quality Control Samples***

- No Quality Control Sample Frequency Outliers occur.

### Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

#### Matrix: Biota

| Analyte Group               | Laboratory sample ID | Client/Ref Sample ID | Analyte | CAS Number | Method | Result       | Limits | Comment  |
|-----------------------------|----------------------|----------------------|---------|------------|--------|--------------|--------|--|
| <b>Duplicate (DUP) RPDs</b> |                      |                      |         |            |        |              |        |  |
| Metals                      | YL2400878-019        | SG24-00-05           | Arsenic | 7440-38-2  | E440   | 42.0 % DUP-H | 40%    | Duplicate RPD does not meet the DQO for this test. |
| Metals                      | YL2400878-019        | SG24-00-05           | Arsenic | 7440-38-2  | E440A  | 42.0 % DUP-H | 40%    | Duplicate RPD does not meet the DQO for this test. |

#### Result Qualifiers

| Qualifier | Description   |
|-----------|---|
| DUP-H     | Duplicate results outside ALS DQO, due to sample heterogeneity. |

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and/or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: Biota

Evaluation: ✗ = Holding time exceedance ; ✓ = Within Holding Time

#### Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: Biota

Evaluation: ✗ = QC frequency outside specification; ✓ = QC frequency within specification.

| Quality Control Sample Type                       | Analytical Methods | Method | QC Lot # | Count |         | Frequency (%) |          |            |
|---|--------------------|--------|----------|-------|---------|---------------|----------|------------|
|   |                    |        |          | QC    | Regular | Actual        | Expected | Evaluation |

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

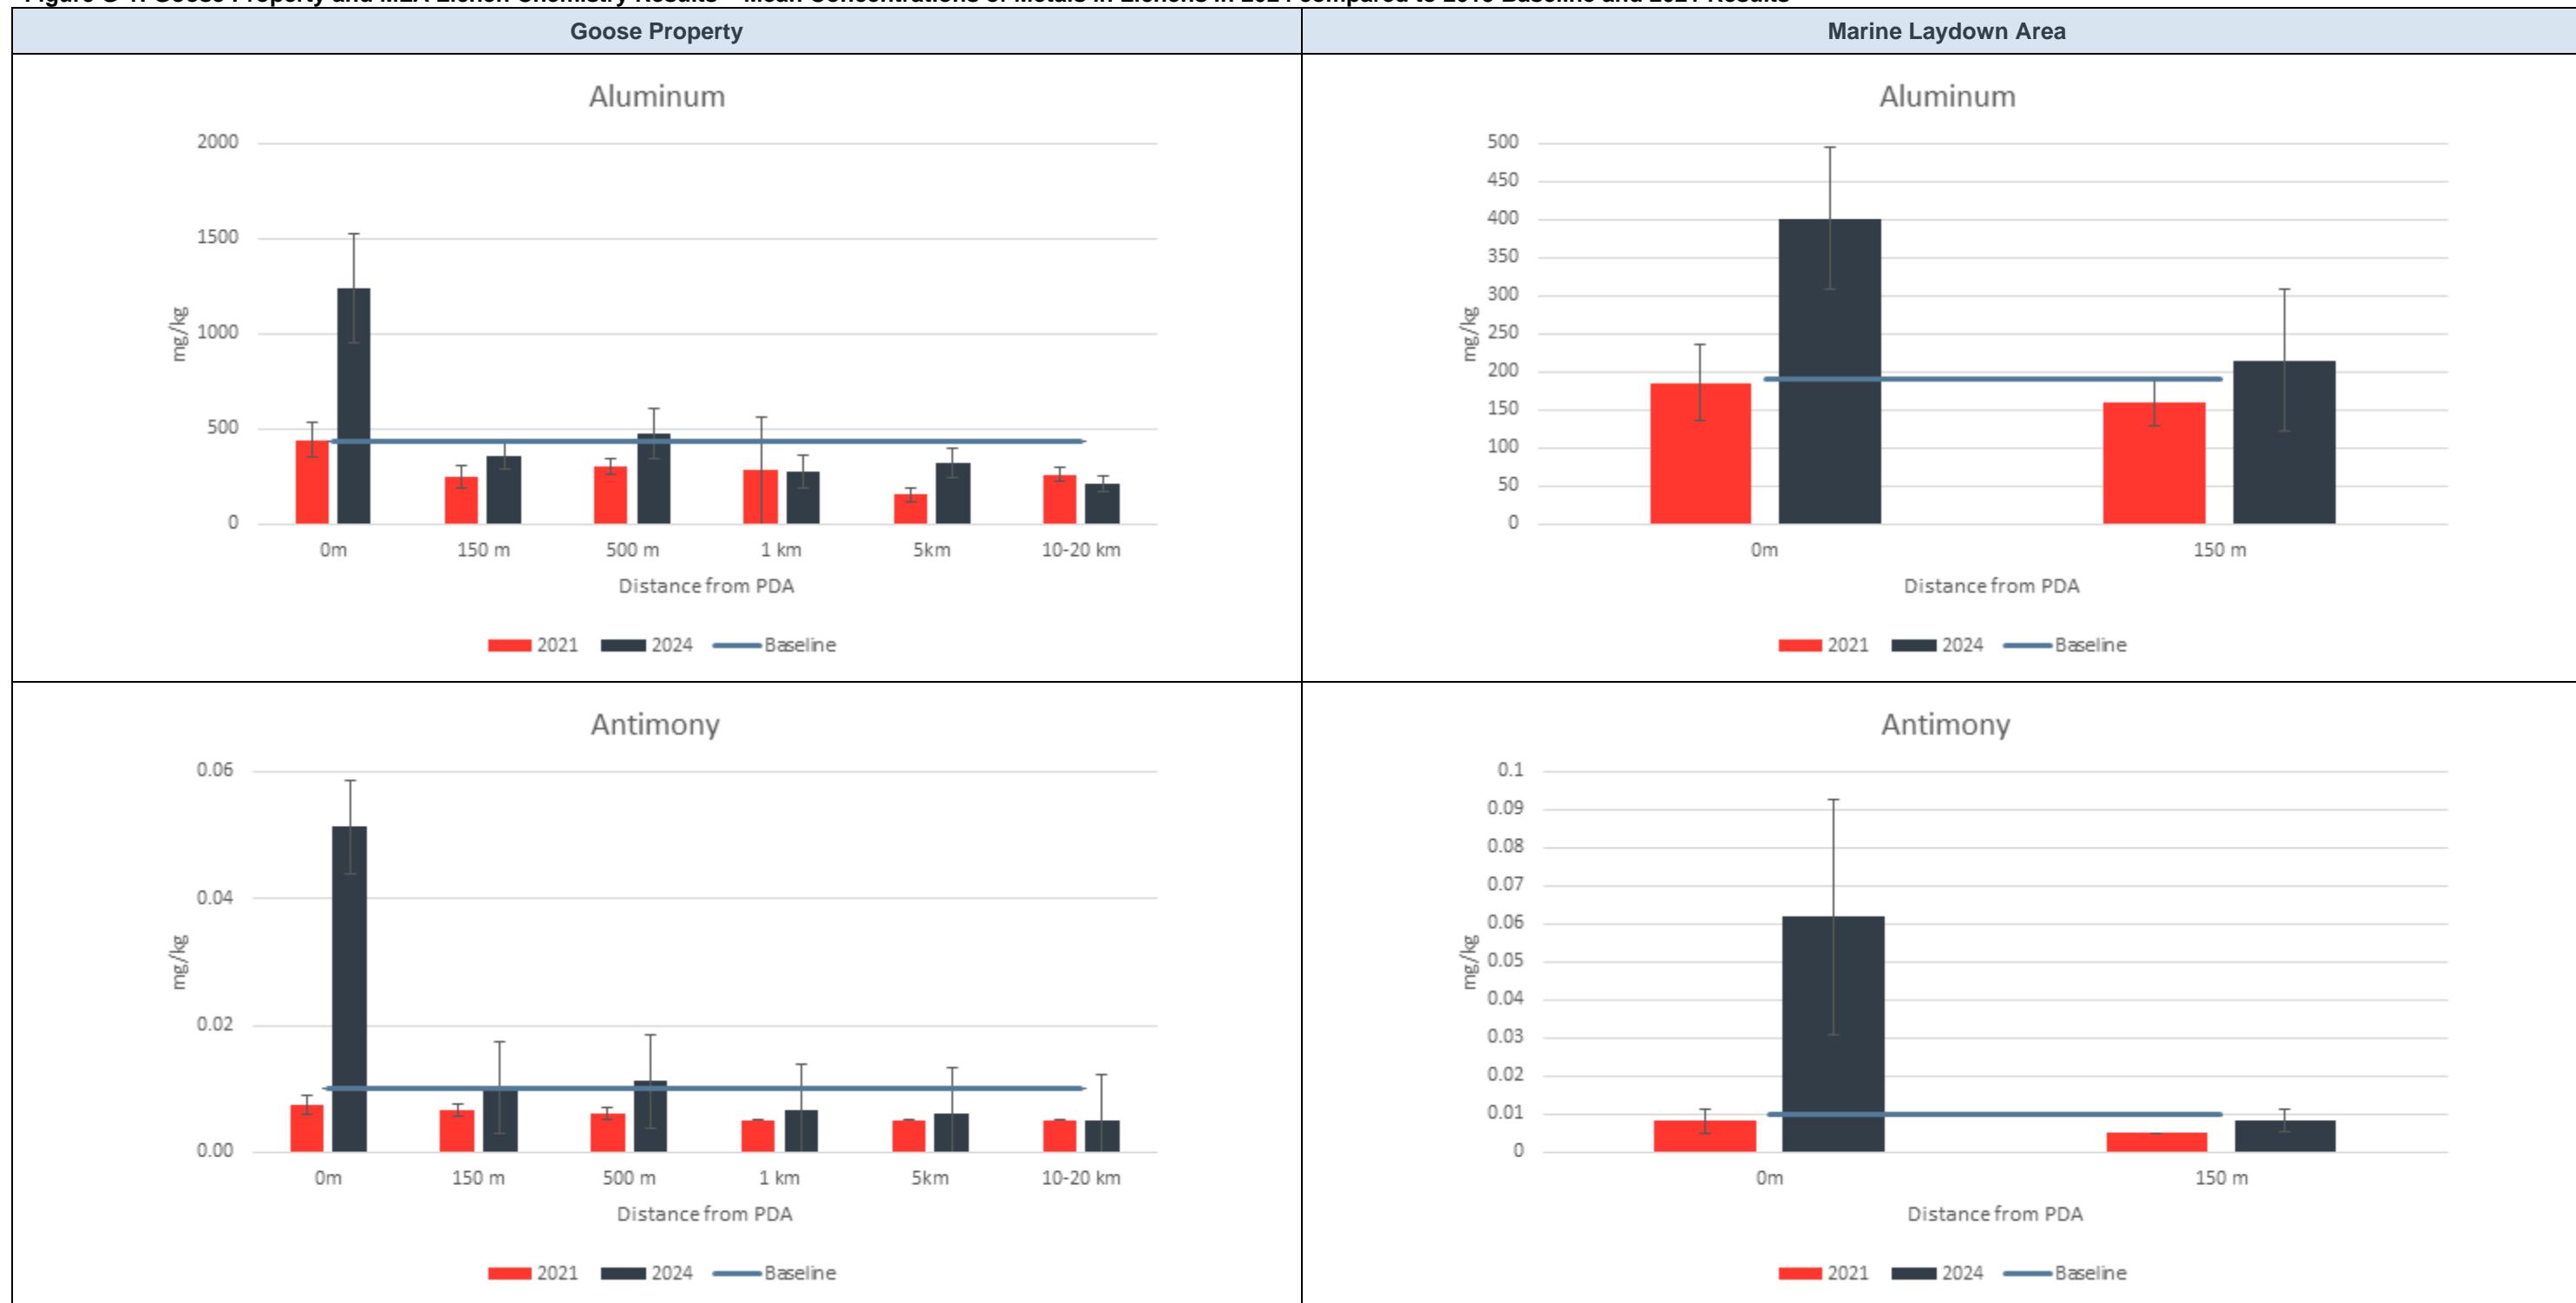

| <b>Analytical Methods</b>                         | <b>Method / Lab</b>                        | <b>Matrix</b> | <b>Method Reference</b>                                       | <b>Method Descriptions</b>   |
|---|--|---------------|---|--|
| Moisture Content by Gravimetry                    | E144<br><br>ALS Environmental - Vancouver  | Biota         | Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1 | Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.   |
| Metals in Biota by CRC ICPMS (DRY units, Routine) | E440<br><br>ALS Environmental - Vancouver  | Biota         | EPA 200.3/6020B (mod)   | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO <sub>3</sub> , HCl, and H <sub>2</sub> O <sub>2</sub> . Analysis is by Collision/Reaction Cell ICPMS.<br><br>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered. |
| Metals in Biota by CRC ICPMS (WET units, Routine) | E440A<br><br>ALS Environmental - Vancouver | Biota         | EPA 200.3/6020B (mod)   | Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO <sub>3</sub> , HCl, and H <sub>2</sub> O <sub>2</sub> .
