McMaster River Watershed	Researching	Municipal	Scientific research has been conducted in the watershed since the 1960s by other parties.	Archeological sites in the area have already been established and will be avoided.	The nearest limit of the watershed is about 2.5 km from Resolute Bay.
North Lake River	Researching	Municipal	To our knowledge, no scientific research has been conducted in the river, but lakes and biology research have certainly been conducted in the surrounding in the past.	The area is not an archeological site, and is well explored by local residents	The community of Resolute Bay is 7 km away from the watershed.

Avatiliriniqmut Ayurhautingit:

This project involves water sampling (< 10L per day, not everyday) from the two main rivers and coring permafrost in a few (~10) locations. All operations are to be performed on foot, except transport to and from the areas on an ATV. The potential impacts are very limited: 1) Soil disturbance in soil pits when permafrost coring. Mitigation: Backfilling the soil pits after the operation 2) Gas spill from ATV and Drill engine fueling operations. Mitigation: Use of a spill kit, filling in Polar continental shelf garage instead of in the field. The research is based at the Polar Shelf facilities, so all potential waste will be dealt with through their system

SECTION G3: Offshore Exploration

SECTION G4: Rig

SECTION H1: Vessel Use

SECTION H2: Disposal At Sea

SECTION I1: Municipal Development

Qanurittuq Ittunik Avatinga: Avatingalluanga

McMaster and North rivers are mostly natural environments, extending from Allen Bay to the interior of Cornwallis Island, up to 16 km inland. The area is a polar desert: slopes are mostly devoid of vegetation except close to the rivers and where lingering snowbanks occur. Permafrost depth is greater than 600m and active layer thaws to 40-70 cm depending on soil properties and conditions.
