ᖃᓪᓗᓈᑎᑐᑦ: Project Title BBC Perfect Planet - Ahiak Migratory Bird Sanctuary (Karrak Lake) - Arctic Foxes There will be 4 members of crew present on location;•Sarah-Jane Walsh – Field Director•Alain Lusignan – Expedition Leader•Ivo Norenberg – Camera Operator•Tom Crowley - Camera OperatorPerfect Planet is a 5-part wildlife television documentary series, which has been filmed over a 4-year period and is due to air on BBC1 in 2020. Episode 1 focuses on how changes in the distribution of sunlight across the globe drive unique animal behaviours and adaptations. Two of our key sequences will showcase how animals cope with periods of no sunlight and perpetual sunlight. We have already filmed the polar night in Ellesmere Island and now wish to film the Midnight sun in the Ahiak (Queen Maud Gulf) Migratory Bird Sanctuary. This location interests us because there is just a short 5-week window when there is no snow on the ground and it is a race against time for animals to rear their young and get ready for the rapidly approaching winter. Our primary objective will be to film arctic foxes at an active den to document the pups in their first few weeks as they begin to explore their new world beyond their den. An additional part of our filming activities will be to document the large numbers of snow geese that nest around Karrak Lake with the aim to film predation by foxes and or other opportunistic predators such as wolves, wolverines and bears. We would also like to film some scenic landscapes with an unmanned aerial vehicle (drone) and wide shots to showcase the nesting goose colonies.There will be two members of the team at Karrak lake within the Ahiak Migratory Bird Sanctuary from the 15th May – 17th July 2019 and the other two members of crew will be present from the 9th June – 9th July 2019. The crew will be based at a permanent research station which has been in use ever summer since 1991 for migratory bird research. No additional camp or infrastructure will be needed. The crew will arrive will arrive when the bird research crew arrives and stay with them until they close camp on the 1st day of the research season and leave as the research station is being closed. This is the only location they will visit with the exception of stopping at Perry River to swap from a helicopter to a twin otter on departure.The crew will use commercial airlines to reach their point of entry and departure in Cambridge Bay, then charter aircraft as detailed below to reach the research station. All charter aircraft from Cambridge Bay is managed by the Polar Continental Shelf Program. These flights will be shared by the other scientific research teams who will also be working out of the research station. The flights are just used for moving people and equipment in and out of the location and not used for filming or scouting for fox den locations.Crew 1 Outbound: Twin Otter from Cambridge Bay to Karrak Lake – 3.5-hour return flight. Return: Helicopter from Karrak Lake to Perry River, then Twin Otter from Perry River to Cambridge Bay. We are using Perry River as a midway stop to save money on helicopter costs. a twin otter is unable to fly in to Karrak Lake due to unsuitable landing conditions.Crew 2 Outbound: Helicopter from Cambridge Bay to Karrak Lake, a twin otter is unable to make the journey this late in the season.Return: Helicopter from Karrak Lake to Cambridge Bay On location crew will travel on foot and in small boats (10ft aluminium with 16 hp engines) owned by the Karrak Lake Research Station to reach the mainland from the station, which is situated on an island. The research station have 3 boats in total which are stored permanently on site. The boats can only be used once the lake melts from around the 10th June and are just used for crossing from the accommodation which is situated on an island to the main land.Karrak Lake has been the subject of an extensive Arctic Fox study over the past 20 years. Due to the knowledgeable research scientist, it is one of the best places in the world to film at an active den with fox cubs. Arctic foxes - We will be following the advice of the scientific experts who will help us locate the best dens for filming. Filming will take place in a camouflaged blind/hide located close to the den location. The crew will also place remotely operated camouflaged cameras to film much closer to the fox dens (less than 10m). This is already being undertaken by scientists at the same location and involves putting the camera down as quickly as possible, ideally before the pups emerge from the den to avoid disturbance and may need occasional maintenance i.e. Battery changes and memory card swaps. Opportunities to do this will be carefully chosen to avoid disturbance

and under the guidance of the scientists.Nesting Geese - One of the objectives will be to film predation on goose nests by arctic foxes and other predators. Filming will be conducted at a distance and the crew will not approach the nest at a distance deemed to cause disturbance to the geese. The crew will attempt to showcase the scale of the goose colony using a drone (unmanned aerial vehicle). This will be done after egg laying and prior to hatching and fledging when all geese are grounded and on the nest. These flights will only be done at the strict discretion of the research scientists. Take off and landing zones will be >100m from the nesting colony and flights will be conducted at a height which does not illicit any signs of disturbance such as head cocking or leaving the nest. Flights will be conducted at an angle to the birds rather than directly overhead to reduce disturbance. The team will begin at a 100m height above the geese and if no disturbance is seen this height may be reduced. At all times during flight a spotter will watch the behaviour of the geese through binoculars. The aim of these UAV flights will be to showcase the scale of these nesting geese and so generally flight will be high and wide.The team are staying with the Karrak Lake research station who have a pre-existing waste management plan; Dry garbage is burned, food waste is buried, recyclables returned to Cambridge Bay, human waste is buried, grey water released away from open water Potential environmental impacts and mitigation measures The camera operators have worked with arctic foxes before and are familiar with their behaviour and how to identify signs of disturbance and or stress. The only species at risk that we expect to encounter are Reindeer, Grizzly Bear & Musk Ox. If the opportunities are available, we would also like to film the natural behaviours of these species. If it is safe to do so without disturbing the animal the crew will position themselves downwind and at a safe distance with the camera.Measures to avoid dangerous wildlife encounters - Dangerous animals which may be encountered; Arctic wolf (Canis lupus arctos); Grizzly bear (Ursus arctos); Wolverine (Gulo gulo); Muskox (Ovibos moschatus).Each field team will carry a scare pistol/pencil launcher and cartridges, and each person will carry a canister of bear spray. Field teams will also carry a shotgun if necessary the expedition leader has completed the Canadian Firearms Safety Course, and holds a valid Possession and Acquisition licence,Community consultation and involvement We are contacting the following community groups;•Ekaluktutiak Hunters & Trappers Organization •Gjoa Hunters' and Trappers' Organization•Umingmaktok HTO Due to time constraints it would be very difficult to hold any local talks or events however we will send each community a copy of the final program once the series is shown on television around the globe.We will be staying in Cambridge Bay using local hotels, restaurants and taxis for crew when they pass through and supplies for the research station are also managed through Cambridge Bay.Future plans within the protected area - We have no future plans within the Ahiak Migratory Bird Sanctuary after the completion of this trip. The end of this trip marks the end of filming for the whole series which is set to air late 2020

Karrak Lake Research Station	Scientific/International Polar Year Research	Crown	The research station at Karrak Lake was establish by Dr Ray Alisauskas and the Canadian Wildlife Service in 1991. It is located on the largest island in Karrak Lake and and it consists of 4 permanent cabins today.	There are lots of inuit artifacts in the region - tent rings, meat caches, inukhuks (stone cairns), stone igloos (which may have been used as caches), kayak racks, blinds, and a stone corral. Aircraft	1	twin otter	The crew will use commercial airlines to reach their point of entry and departure in Cambridge Bay, then charter aircraft as detailed below to reach the research station. All charter aircraft from Cambridge Bay is managed by the Polar Continental Shelf Program. These flights will be shared by the other scientific research teams who will also be working out of the research station. The flights are just used for moving people and equipment in and out of the location and not used for filming .
Boat	1	10ft	On location crew will travel on foot and in small boats (10ft aluminium with 16 hp engines) owned by the Karrak Lake Research Station to reach the mainland from the station, which is situated on an island. The research station have 3 boats in total which are stored permanently on site. The boats can only be used once the lake melts from around the 10th June and are just used for crossing from the accommodation which is situated on an island to the main land.

Propane	fuel	1	1	1	Liters	Cooking - this is provided and managed by the Karrak Lake Research Stationwho are providing our crew with cooked meals. Karrak Lake have a Task Hazard Analyses (THA) and Safe Work Procedures (SWP) in place for the use, maintenance and disposal.
Diesel	fuel	1	1	1	Liters	On location crew will travel on foot and in small boats (10ft aluminium with 16 hp engines) owned by the Karrak Lake Research Station to reach the mainland from the station, which is situated on an island. The research station have 3 boats in total which are stored permanently on site. The boats can only be used once the lake melts from around the 10th June and are just used for crossing from the accommodation which is situated on an island to the

						main land. This diesel is provided by Karrak Lake and there is a Task Hazard Analyses (THA) and Safe Work Procedures (SWP) in place for the use, maintenance and disposal.
Turbo B Fuel	fuel	1	1	1	Liters	The main cabin is heated by an oil stove that burns waste turbo fuel. Turbo B (turbo B is a mixture of ~2/3 kerosene and ~1/3 naptha (the latter also known as white gas)) instead ofkerosene). This is provided by and managed by Karrak Lake Research Station, who have Task Hazard Analyses (THA) and Safe Work Procedures (SWP) in place for the use, maintenance and disposal.

Camp	ᐊᑲᑕᑯᑦ ᐃᓯᐊᓪᓕᑕᐅᔪᓐᓇᖅᑐᑦ	1	Dry garbage is incinerated in the burning barrels east of the cabin.	n/a
Camp	ᐊᑲᑕᑯᑦ ᐃᓯᐊᓪᓕᑕᐅᔪᓐᓇᖏᑦᑐᑦ	1	All “non-burnables” (tin cans, various metals, glass, etc.) are shipped to Cambridge Bay for disposal.	n/a
Camp	ᐅᔾᖁᐃᓴᔾᐃᓂᖅ ᓄᓇᒥᑦ ᓄᑎᓇᓂᖅ ᐊᑐᐸᐅᔪᓐᓇᖅᑲᖏᓐᓂᐅᓂᖅ, ᓇᒡᒐᖁᓕᓂᖅ	1	Compost is dumped into pits near the burning barrels (see below) and then immediately buried, to prevent access by bears. Until we are ready to close a pit, compost bags can be placed in metal trunks, and rockeddown, as for lou bags	n/a
Camp	ᖁᑯᑕᓪᓚᓂᐊᖅ	2	2kg per day We deposit our biological wastes in a container called the Honey Bucket. This finereceptacle is found, not surprisingly, in the outhouse. Tampons and sanitary napkins are to be burnedand not deposited in the lou. Also, no peeing in the lou, please. Lou bags (and compost bags)	n/a

			aretemporarily stored in metal trunks located near the biffy. Once enough lou and compost bags haveaccumulated to fill a pit dug near the burn barrels, the bags are dumped, the plastic bags themselves areburned, and the pits are filled in with ash and soil.	

ᐊᕙᑎᒥᐅᑕᓖᑦᑐᑦ ᐊᒃᑐᕐᑕᐅᓯᒪᔪᑦ

The only species at risk that we expect to encounter are Rangifer tarandus, Ursus arctos & Gulo gulo. We would also like to opportunistically film these species natural behaviours. If any species at risk are sighted the crew will be sure to establish their location in proximity to where they are currently situated and their direction of travel. If it is safe to do so without disturbing the animal the crew will position themselves downwind and at a safe distance with the camera, we would expect this would be somewhere between 30-100m from the animals. However, if they seem calm and not disturbed the crew may approach closer if it is safe to do so. Whilst travelling around generally the crew will avoid disturbing any nesting birds, particularly those listed above, the crew will be made aware of all species at risk present. Disturbance of arctic fox den sites - Team will be following the advice of the scientific experts who will help us locate the best dens for filming. The camera operators have worked with arctic foxes before and are familiar with their behavior and how to identify signs of disturbance and or stress. The crew will be working in a hide and will start at a distance of 100m for the den site and progressively move closer should there be no signs of disturbance, the aim would be to reach a distance of around 30m from the den location Disturbance of nesting Ross's and Lesser snow geese - The crew will follow the instruction of research staff regarding moving through, approaching and filming nesting geese.Filming will be conducted at a distance and the crew will not approach the nest at a distance deemed to cause disturbance to the geese. The crew will attempt to film the goose colony using a UAV. This will be done after egg laying and prior to hatching and fledging when all geese will be on the ground and on the nest. These flights will only be done at the strict discretion of the research scientists.
