Table 3: Caribou Monitoring Measures

Program	Program Objective	Timing	Methods and Location
Collar Analysis	Evaluate if caribou are avoiding the site.	<ul style="list-style-type: none"> Pre-construction for 2 years. During construction. Post-construction – after 3 years. 	<ul style="list-style-type: none"> Collar data analysis to evaluate the number of collars near windfarm (within 1 km) to control areas (beyond 10 km) and before vs. after construction.
Trail Cameras	Evaluate if caribou continue to use the site.	<ul style="list-style-type: none"> Pre-construction for 2 years. During construction. Post-construction for 3 years. 	<ul style="list-style-type: none"> Install cameras on trails near windfarm (within 1 km) and control areas (beyond 10 km). Compare caribou abundance near vs. far and before vs. after construction.
Behaviour	Evaluate if caribou behaviour is affected by the wind turbines	<ul style="list-style-type: none"> Pre-construction for 2 years. During construction. Post-construction for 3 years. 	<ul style="list-style-type: none"> Conduct behaviour surveys in late June through early July. Survey near windfarm (within 1 km) and control areas (beyond 10 km). Compare caribou behaviour near vs. far and before vs. after construction.

Table 4: Triggers and Management Responses for Caribou Avoidance of Windfarm Site

Action Level	Trigger	Management Response
None	<ul style="list-style-type: none"> No detectable reduction in the number of caribou using trails near the windfarm. 	<ul style="list-style-type: none"> Consider if mitigation is excessive after 3 years and reduce thresholds as appropriate.
Low	<ul style="list-style-type: none"> 50 to 80% reduction in caribou occurrence less than the Meliadine Extension FES Addendum which predicted 95% reduction in caribou occurrence within 5 km. 	<ul style="list-style-type: none"> Audit mitigations to ensure mitigations are being applied correctly. Continue monitoring.
Medium	<ul style="list-style-type: none"> 81 to 94% reduction in caribou occurrence less than the Meliadine Extension FES Addendum which predicted 95% reduction in caribou occurrence within 5 km. 	<ul style="list-style-type: none"> Audit mitigations to ensure mitigations are being applied correctly. Compare area of avoidance with data from monitoring programs for noise to determine what mechanism may be causing caribou to avoid the windfarm. For an identified potential cause of avoidance, add mitigation measures to reduce effect. Continue monitoring.
High	<ul style="list-style-type: none"> Detectable avoidance of the windfarm above the level predicted in the Meliadine Extension FES Addendum prediction (i.e., 95% reduction occurrence in caribou within 5 km). 	<ul style="list-style-type: none"> Audit mitigations to ensure mitigations are being applied correctly. Compare area of avoidance with data from monitoring programs for noise to determine what mechanism may be causing caribou to avoid the windfarm. Implement adaptive management to further control noise based on results of comparisons/research above. Continue monitoring.
