BACK RIVER ENERGY CENTRE PROJECT

The Back River Project Energy Centre, a wind generation facility, solar panel array and Battery Energy Storage System, capable of supplying clean energy to the Back River Project Mine.

Solar Array and Electrical Station
will be located near the Diesel Power Plant.

Electrical transmission lines will be laid directly on the tundra and/or laid directly adjacent to the access roads and covered with aggregate.

Solar panels may also be added.

Additional electricity generated by the wind turbines and solar array will be stored by the **Battery Energy Storage System**. The Battery Energy Storage System consists of lithium-ion batteries stored in a seacan on an aggregate pad and will be capable of storing energy to be used at times when wind and solar energy is not available.

Up to **13** planned Wind Turbine Generators.

Between **4.0 and 4.5 MW**

power capacity per wind turbine giving the system a generation capacity of approximately 55 MW of electricity, which is sufficient to cleanly power the Back River Project Mine.

Approximately **500 m** between wind turbines.

KEY MITIGATION

- Noise will attenuate to 45 db by 500 m, which will not disturb animals (see Noise to right).
- The wind towers will be shut down when groups of caribou approach during sensitive seasons.
- Behavioural and avoidance monitoring will determine if caribou are bothered by the wind tower and allow for adaptive management.
- The wind towers will be shut down during peak bird migration, at night during fog – research worldwide has shown that this combination of conditions can be dangerous for birds around wind towers.
- Monitoring will look for bird mortalities due to the wind towers and allow for adaptive management.

BENEFITS

Reduction of up to
~700 fuel truck trips per year

Reduction of
~15% sealifts per year

~50% less fuel per year
~50% less greenhouse gas emissions

NOISE

Sabina conducted noise modeling to determine how loud the wind towers will be at various distances. Noise is measured in decibels (db) which is a logarithmic scale. That means the noise you hear doubles with every 7 db.

At 500 m from the wind towers, the noise will be similar to a person talking quietly and barely above the noise of a typical day on the tundra.

HEIGHT COMPARISON

Cambridge Bay LORAN Tower
189 m tall

Wind Turbines
111 m tall

The taller that wind towers are, the more efficient they can be. Being tall avoids the boundary layer of slow-moving air near the surface and allows for large, slower-moving blades.

Centre Square - Northern Heights
(Tallest building in Yellowknife)
60 m tall
