## 1. INTRODUCTION

The following report covers data acquisition, data processing, data delivery and instrument specifications involved in the completion of this project. This report does not include any geological interpretations of the dataset.

### 1.1 Project Overview

<b>Date In</b>	July 26, 2024
<b>Date Out</b>	August 13, 2024
<b>Client</b>	Baffinland Iron Mines
<b>Survey Location</b>	Baffin Island, Nunavut
<b>Survey Area</b>	1530 km <sup>2</sup>
<b>Aircraft Model</b>	Airbus Helicopters AS350 B2 C-GHUV
<b>Aircraft Operator</b>	Canadian Helicopters Ltd.
<b>Takeoff &amp; Landing Site</b>	Mary River Aerodrome (YMV)
<b>Data Collection</b>	Jean-François Dionne, Michael Burns
<b>Data Processing &amp; QA/QC</b>	Jean-François Dionne

### 1.2 Project Deliverables & Specifications

<b>Deliverable</b>	<b>Format</b>	<b>Specification</b>	<b>Remarks</b>
Point Cloud	LAS Ver. 1.4	Approx. 10-15 pts/m <sup>2</sup>	Entire area
DTM	GeoTIFF	50cm Resolution	Entire area
Orthophoto	GeoTIFF	8-10 cm resolution	Entire area

## 2. DATA ACQUISITION

### 2.1 Geodetic Parameters

<b>Horizontal CRS</b>	NAD83 (CSRS) / UTM zone 17N (EPSG 2958)
<b>Vertical CRS</b>	CGVD2013
<b>Geoid</b>	CGG2013a
<b>EPOCH</b>	2010.000

### 2.2 Reference Stations

Reference stations were established to provide high-precision GNSS corrections for trajectory post-processing. The table below lists the reference stations used for processing. Reference station data was corrected using Canadian Spatial Reference System Precise Point Positioning (CSRS-PPP) service, and the correction details can be found in [Appendix 4](#).

### 2.3 Ground Control Points

Ground Control Points (GCPs) are precisely surveyed locations that improve the accuracy of airborne LiDAR and orthophoto datasets. They provide ground truth, serving as reference markers to validate and adjust the dataset to real-world measurements. GCPs help assess accuracy, identify discrepancies, and apply corrections, ensuring reliable, high-precision mapping and analysis.

Ground Control Points were used to ensure data accuracy, with the acquisition details and full list provided in [Appendix 5](#).

### 2.4 Flight Planning & Execution

The table below lists the flights conducted for the survey including relevant details. Additional flight planning parameters and instrument setup information can be found in [Appendix 1](#). Instrument settings for the LiDAR sensor can be found in [Appendix 2](#), and for the integrated camera system in [Appendix 3](#).

## 3. DATA PROCESSING

### 3.1 Trajectory Post-Processing

NovAtel's Inertial Explorer software is used in two stages to produce a post-processed and corrected flight trajectory.

In the GNSS processing stage, raw satellite data is collected from the base station and sensor receivers. Differential correction is applied to adjust for atmospheric delays, satellite geometry, and timing errors. This produces a refined position that is used to update sensor coordinates during calibration and data processing.

In the tightly coupled processing stage, inertial measurement unit (IMU) data is combined with GNSS data in a single estimation process. This integration of accelerometer and gyroscope measurements with satellite observations results in improved accuracy and robustness even when satellite signals are weak or obstructed.

### 3.2 Point Cloud Processing

Throughout the LiDAR processing workflow, error sources including sensor ranging, lever arms, atmospheric conditions, GNSS and IMU offsets, are analyzed and minimized. Vertical accuracy is mostly affected by GNSS and atmospheric factors, while horizontal accuracy is mostly dependant on GNSS, IMU and LiDAR lever arms.

Phoenix LiDAR Systems' Spatial Explorer software resolves Multiple Time Around (MTA) ambiguities in the raw LiDAR returns. The post-processed trajectory is imported and used to generate the point cloud using real-world corrected coordinates. A cloverleaf flight pattern enables boresight calibration to reduce misalignment between the LiDAR sensor and the IMU. When available, ground control points verify that initial accuracies fall within acceptable limits.

Bayes Map's Strip Align fine tunes the alignment of overlapping flight lines by adjusting common areas between adjacent strips. Ground control points are used for absolute correction and accuracy assessment, producing the final corrected point cloud solution.

Terrasolid's TerraScan software classifies points into the required deliverable categories. A scripted method removes outliers and noise, extracts bare-earth points with an iterative surface model, and classifies over-ground features such as low vegetation, high vegetation, and buildings.

Blue Marble Geographics' Global Mapper then uses the classified point cloud to produce Digital Elevation Models. The Triangulated Irregular Network method generates a Digital Terrain Model from bare-earth points and a Digital Surface Model from all points excluding noise. Global Mapper also creates contour lines and various topographic analyses when needed.

## 4. RESULTS & QUALITY CONTROL

### 4.1 Trajectory Validation

The following table summarizes key trajectory validation metrics. See [Appendix 6](#) for graphs and detailed analysis. Descriptions and values are sourced from [Inertial Explorer Documentation](#).

**Table 2 Summary of Trajectory Validation Metrics**

Metric	Description	Unit	Acceptability Threshold	Pass
Forward/Reverse Separation (Fixed)	Difference between forward and reverse GNSS/IMU solutions where both have fixed integer ambiguities, indicating consistency	m	< ±0.30	Yes
Estimated Position Accuracy	Standard deviation of the east, north and up directions. Summary of error sources, including the float/fixed ambiguity status and satellite geometry.	m	XY: < 0.05 Z: < 0.10	Yes
PDOP (Position Dilution of Precision)	Unitless indicator of how favorable the satellite geometry is to 3D positioning accuracy	-	≤ 3.0	Yes
Estimated Attitude Accuracy	Standard deviation computed in the GNSS/IMU Kalman filter in terms of roll, pitch and heading	arcmin	< 0.60	Yes

## **Appendix 2**

### **Instrument Specification – LiDAR System**

## QUICK SPECS

Absolute Accuracy  
25-50 mm @ 350 m Range

PP Attitude Heading RMS Error  
0.010° / 0.019° IMU options

Weight (including AIR NavBox)  
5 kg / 11 lbs

Dimensions (with AIR NavBox)  
348.5 x 164 x 189 mm

Laser Range  
900 m @ 20% Reflectivity

Scan Rate  
1800 kHz, up to 15 returns

## APPLICATIONS

Utilities Mapping

Railway Track Mapping

Agriculture & Forestry Monitoring

Open Pit Mining Operations

General Mapping

## RANGER XL

The **Ranger XL** is a lightweight airborne laser scanner, especially designed for use on UAS and small manned aeroplanes or helicopters. With its wide field of view of 75 degrees and an extremely fast data acquisition rate of up to 1.8 MHz, the **Ranger XL** is perfectly suited for high point density corridor mapping applications such as power line, railway track and pipeline inspection.

## FEATURES

- » Easily mountable to unmanned platforms (UAVs) and to helicopters, gyrocopters, and other small manned aircrafts.
- » Operating flight altitude up to 1,400 m / 4,600 ft
- » Scan speed up to 400 lines/second

## PLATFORM

OVERALL DIMENSIONS (with AIR NavBox)	352 x 164 x 185 mm
OPERATING VOLTAGE	18 - 34 V DC
POWER CONSUMPTION	75 W
OPERATING TEMPERATURE	-10° - +40° C
WEIGHT (including Air NavBox)	4.4 kg / 11 lbs

## LiDAR SENSOR

LASER PROPERTIES	1550 nm
RANGE MIN	5 m
MAX EFFECTIVE MEASUREMENT RATE	up to 1,500,000 meas./sec
HORIZONTAL FIELD OF VIEW	75°
ACCURACY	20 mm
PRECISION	15 mm
LASER BEAM DIVERGENCE	0.35 mrad
LASER BEAM FOOTPRINT (GAUSSIAN BEAM DEFINITION)	35 mm @ 100 m, 175 mm @ 500 m, 350 mm @ 1000 m
MAX MEASURING RANGE P 20% (P 60%)	900 m (1400 m)
SENSOR CLASSIFICATION	IP64 dust and splash-proof
WEIGHT	≤ 3.8 kg (without IMU/GNSS)
POWER CONSUMPTION	65 W
