

Demande de la CNER faisant l'objet d'un examen préalable #125843

Impacts of wastewater at Baker Lake, Nunavut

Type de demande : New

Type de projet: Scientific Research

Date de la demande : 8/1/2023 6:26:24 PM

Period of operation: from 0001-01-01 to 0001-01-01

Autorisations proposées: from 0001-01-01 to 0001-01-01

Promoteur du projet: Rob Jamieson
Dalhousie University
1360 Barrington Street
Halifax Nova Scotia B3J 1Z1
Canada
Téléphone :: 9028801501, Télécopieur ::

DÉTAILS

Description non technique de la proposition de projet

Anglais: The overall objective of this research program is to understand the impacts of the Baker Lake, NU, wastewater treatment system on environmental and human health, and develop recommendations for improving wastewater management in the community. The current wastewater treatment system in Baker Lake consists of a pond-wetland complex that ultimately discharges into Baker Lake. Baker Lake is important fish habitat and also provides the water supply for the community of Baker Lake. Wastewater accumulates in a small detention pond during the winter months (October – May), and then discharges in an uncontrolled manner into the wetland as it thaws during the spring freshet. This scenario is typical of many wetland treatment areas in Nunavut, and has been documented to contribute to poor levels of wastewater treatment that may pose a risk to both human and environmental health. The research program will involve an interdisciplinary team of researchers and will employ a holistic approach to characterize the impacts of the current wastewater treatment system on environmental and human health.

Français: L'objectif global de ce programme de recherche est de comprendre les impacts du système de traitement des eaux usées de Baker Lake (NU) sur l'environnement et la santé humaine, et de formuler des recommandations pour améliorer la gestion des eaux usées dans la communauté. Le système actuel de traitement des eaux usées de Baker Lake consiste en un complexe étang-zone humide qui se déverse finalement dans le lac Baker. Le lac Baker est un habitat important pour les poissons et constitue également une source d'approvisionnement en eau pour la communauté de Baker Lake. Les eaux usées s'accumulent dans un petit bassin de rétention pendant les mois d'hiver (d'octobre à mai), puis se déversent de manière incontrôlée dans la zone humide lors du dégel pendant la crue printanière. Ce scénario est typique de nombreuses zones de traitement des zones humides au Nunavut, et il a été prouvé qu'il contribue à des niveaux médiocres de traitement des eaux usées qui peuvent constituer un risque pour la santé humaine et environnementale. Le programme de recherche impliquera une équipe interdisciplinaire de chercheurs et utilisera une approche holistique pour caractériser les impacts du système actuel de traitement des eaux usées sur l'environnement et la santé humaine.

Personnel

Personnel on site: 2

Days on site: 25

Total Person days: 50

Operations Phase: from 2023-06-01 to 2026-06-02

Activités

Emplacement	Type d'activité	Statut des terres	Historique du site	Site à valeur archéologique ou paléontologique	Proximité des collectivités les plus proches et de toute zone protégée
Shoreline Baker Lake (near drinking water intake and treatment plant)	Sampling sites	Municipal	Shoreline of Baker Lake	No known archeological value	500 m
Input to Baker Lake (wastewater effluent enters here)	Sampling sites	Municipal	Municipal wastewater discharge location	No known archeological value	500 m
Airplane Lake outflow	Sampling sites	Municipal	Outflow from lake receiving municipal wastewater	No known archeological value	700 m
Upstream background site	Sampling sites	Municipal	Upstream of municipal wastewater lagoon and wetland treatment area	No known archeological value	800 m

Engagement de la collectivité et avantages pour la région

Collectivité	Nom	Organisme	Date de la prise de contact
Baker Lake	Sheldon Dorey	Hamlet of Baker Lake	2022-11-16

Autorisations

Indiquez les zones dans lesquelles le projet est situé:

Kivalliq

Autorisations

Organisme de régulation	Description des autorisations	État actuel	Date de l’émission/de la demande	Date d’échéance
Pêches et Océans Canada	Authorization to collect fish samples	Applied, Decision Pending		

Project transportation types

Transportation Type	Utilisation proposée	Length of Use
Air		
Land		

Project accomodation types

Collectivité

Utilisation de matériel

Équipement à utiliser (y compris les perceuses, les pompes, les aéronefs, les véhicules, etc.)

Type d'équipement	Quantité	Taille – Dimensions	Utilisation proposée
boat	1	< 20'	A small boat would be used to carry sampling equipment, including samplers, to offshore sites.
passive samplers	9	20 cm diameter x 30 cm length	Passive water samplers will be deployed at sites for up to 3 weeks each, during the sampling season. These require no power to operate, and would be deployed by cable attached to fixed points on shore (e.g., poles or existing structures) or buoys if offshore. All equipment will be removed at the end of the field season.
primary productivity measures	9	1 m ²	These consist of sealed bottles with known algal and nutrient compositions, and would be deployed on site to measure algal productivity. They would be removed after measurements are done.
current meters	6	10 cm	We will be measuring stream flow downstream of the existing wastewater treatment plant using portable current meters. Water level loggers (10 cm in size) will be deployed in the stream beds in-stream for the season, to monitor water flow continuously, and removed at the end of the summer.
Quadrats	1	1 m x 1 m	Quadrats will be used to characterize vegetation and wetland presence in the vicinity of the existing wastewater treatment system and reference site. This will involve transecting the tundra on foot, placing a temporary 1 m x 1 m PVC quadrat on the ground surface, and taking photographs, and at times collecting small soil samples (<500 g).
truck	1	standard size pickup truck	A pickup truck or similar vehicle would be used to carry sampling equipment to onshore sites.

Décrivez l'utilisation du carburant et des marchandises dangereuses

Décrivez l'utilisation de carburant :	Type de carburant	Nombre de conteneurs	Capacité du conteneur	Quantité totale	Unités	Utilisation proposée
Diesel	fuel	1	50	50	Liters	Diesel fuel for the small boat listed above. Estimated maximum amount used for sampling work during the season.
Gasoline	fuel	1	100	100	Liters	Gasoline for the sampling truck listed above. Estimated maximum amount used for sampling work during the season.

Consommation d'eau

Quantité quotidienne (m3)	Méthodes de récupération de l'eau proposées	Emplacement de récupération de l'eau proposé
0		

Déchets

Gestion des déchets

Activités du projet	Type des déchets	Quantité prévue	Méthode d'élimination	Procédures de traitement supplémentaires
Information is not available				

Répercussions environnementales :

The proposed project will involve sampling of water, sediments, microorganisms and fish in a lagoon/wetland/stream system currently receiving municipal wastewater. Up to 10 fish/species/lake will be collected, humanely euthanized following conditions of our animal care license (cervical dislocation and swift blow to the head), and sampled for flesh, liver (contaminant concentrations), and otoliths (fish age).

SECTION B10: Geology

SECTION B11: Mine

SECTION B12: Mill

SECTION C1: Pits

SECTION D1: Facility

SECTION D2: Facility Construction

SECTION D3: Facility Operation

SECTION D4: Vessel Use

SECTION E1: Offshore Survey

SECTION E2: Nearshore Survey

SECTION E3: Vessel Use

SECTION F1: Site Cleanup

SECTION G1: Well Authorization

SECTION G2: Onland Exploration

SECTION G3: Offshore Exploration

SECTION G4: Rig

SECTION H1: Vessel Use

SECTION H2: Disposal At Sea

SECTION I1: Municipal Development

Description de l'environnement existant : Environnement physique

The physical environment that will be studied includes the current municipal wastewater lagoon, treatment wetland and receiving environment.

Description de l'environnement existant : Environnement biologique

The current biological environment to be studied includes microorganisms, invertebrates and fish in the wastewater treatment system.

Description de l'environnement existant : Environnement socio-économique

The work will be conducted in the community of Baker Lake, Nunavut.

Miscellaneous Project Information

Identification des répercussions et mesures d'atténuation proposées

We do not anticipate any negative impacts.

Répercussions cumulatives

We do not anticipate any cumulative effects.

Impacts

Identification des répercussions environnementales

	PHYSICAL	Designated environmental areas	Ground stability	Permafrost	Hydrology / Limnology	Water quality	Climate conditions	Eskers and other unique or fragile landscapes	Surface and bedrock geology	Sediment and soil quality	Tidal processes and bathymetry	Air quality	Noise levels	BIOLOGICAL	Vegetation	Wildlife, including habitat and migration patterns	Birds, including habitat and migration patterns	Aquatic species, incl. habitat and migration/spawning	Wildlife protected areas	SOCIO-ECONOMIC	Archaeological and cultural historic sites	Employment	Community wellness	Community infrastructure	Human health
