DÉTAILS

Description non technique de la proposition de projet

Anglais: Northwest Passage Science and Early Career TrainingDr. Laurie Juranek and Dr. Emily Eidam, Oregon State UniversityThis project involves marine research and early career scientist training on the USCGC Healy transit of the Northwest Passage from Kugluktuk, Canada to Nuuk, Greenland. We aim to instill best practices in managing objectives of interdisciplinary science teams and working effectively with the US Coast Guard, international partners, and Indigenous communities in planning and executing a cruise and communicating results broadly to local communities and the public.Science research questions: (1) Can we fill gaps in data on Northwest Passage seafloor bathymetry and map navigational hazards? (2) How does transport of water through the Northwest Passage fit into the broader Arctic Ocean circulation? How do water parcels change chemically and physically? (3) How can we improve models of the growth and decay of sea ice based on meteorological, sea ice, and ocean surface condition data?For (1), we propose to fill critical bathymetric gaps, help work toward complete seafloor mapping, and aid navigational hazard identification. We will work with Canadian Researchers from NRCAN and GSC to prioritize mapping locations. We also propose to collect seabed samples to improve an atlas of seabed sediments in development by Canadian researcher Dr. David Mosher. We will use samples to help train early career scientists in sampling methods and allow them to collect benthos, genomic data, and nutrient data.For (2) we will monitor surface seawater while transiting using shipboard sensors, in order to understand how the chemical composition of seawater changes through the region with the flow of ocean currents. We will collect vertical profiles of water column properties as well as water samples to analyze properties including conductivity, temperature, nutrients, and other properties using a ship-based profiler at select sites and using small expendable sensors between stations. Water samples will be stored onboard and returned to individual laboratories for analysis.For (3), we will collect meteorological and ocean surface measurements (drift rates, wind speeds, ocean surface temperature and salinity, light profiles) near sea ice and from an ice-based station. We also plan to collect ice samples if possible by drilling small holes with an auger.We very much hope to build connections with regional hamlets and to reflect their knowledge and interests in our research and training efforts. We plan to visit Kugluktuk and Cambridge Bay this spring to connect with communities before the busy summer season. We also hope to organize a community event in Kugluktuk in late July to facilitate informal knowledge exchange among the community, our science party, and the USCG vessel officers prior to departure. We understand the importance of communicating our findings to local communities, and will plan an in-person follow-up trip in 2025.Data will be shared with the GSC and NRCAN and sent to Indigenous permitting authorities. Data collected in transit will be shared within 6 months of the survey. Data from discrete samples/measurements will be shared within 2 years of the survey (some require processing time).

Français: Etude du Passage du Nord-Ouest et formation de jeunes chercheursCe projet s'articule autour d'un projet de recherche et deformation de jeunes chercheurs sur le transit USCGC Healy allant du passage du Nord-Ouest, de Kugluktuk, au Canada, à Nuuk, au Groenland. Nous visons à inculquer les meilleures pratiques dans la gestion des objectifs d'équipes scientifiques interdisciplinaires et à travailler efficacement avec les Gardes Côtes américains, les partenaires internationaux, et les communautés autochtones, pour planifier et exécuter une campagne de recherche et communiquer les résultats aux communautés locales et au grand public.Questions de recherche scientifique : (1) Pouvons-nous combler les lacunes dans les données de bathymétrie des fonds marins du passage du Nord-Ouest et cartographier les dangers pour la navigation ? (2) Comment le transport de l'eau à travers le passage du Nord-Ouest s'intègre-t-il dans la circulation plus large de l'océan Arctique ? Comment les parcelles d'eau changent-elles chimiquement et physiquement ? (3) Comment pouvons-nous améliorer les modèles de croissance et de dégradation de la glace de mer sur la base des données météorologiques, de la glace de mer et de l'océan de surface ?Pour (1), nous proposons de combler les lacunes bathymétriques critiques, de contribuer à la cartographie complète des fonds marins et de faciliter l'identification des dangers pour la navigation. Nous travaillerons avec des chercheurs canadiens de RNCan et de la CGC pour prioriser les emplacements à cartographier. Nous proposons également de collecter des échantillons de fonds marins pour améliorer un atlas des sédiments des fonds marins en cours d'élaboration par le chercheur canadien David Mosher. La collection des échantillons aidera à former des jeunes chercheurs aux méthodes d'échantillonnage et leur permettre de collecter des données sur le benthos,

des données génomiques et des données sur les éléments nutritifs.Pour (2), nous analyserons l'eau de mer de surface lors de son transit à l'aide de capteurs embarqués, afin de comprendre comment la composition chimique de l'eau de mer change dans la région avec le flux des courants océaniques. Nous collecterons des profils verticaux des propriétés de la colonne d'eau ainsi que des échantillons d'eau pour analyser les propriétés, notamment la conductivité, la température, les nutriments et autres, à l'aide d'un profileur embarqué sur des sites sélectionnés et à l'aide de capteurs compacts et jetables entre les stations. Les échantillons d'eau seront stockés à bord et renvoyés aux laboratoires individuels pour analyse.Pour (3), nous collecterons des mesures météorologiques et de surface océanique (taux de dérive, vitesses du vent, température et salinité de la surface de l'océan, profils de pénétration de la lumière) près de la glace de mer et à partir d'une station basée sur la glace. Nous prévoyons également de prélever des échantillons de glace si possible en forant de petits trous avec une tarière.Nous espérons ardemment établir des liens avec les hameaux régionaux et refléter leurs connaissances et leurs intérêts dans nos efforts de recherche et de formation. Nous prévoyons visiter Kugluktuk et Cambridge Bay ce printemps pour établir des liens avec les communautés avant la saison estivale. Nous espérons également organiser un événement communautaire à Kugluktuk fin juillet pour faciliter l'échange informel de connaissances entre la communauté, notre équipe scientifique et les officiers du navire de l'USCG avant le départ. Nous comprenons l'importance de communiquer nos résultats aux communautés locales et planifierons un voyage de suivi en personne en 2025.Les données seront partagées avec la GSC et RNCan et envoyées aux autorités autochtones chargées de délivrer les permis. Les données collectées en transit seront partagées dans les 6 mois suivant la mission. Les données provenant d'échantillons/mesures discrètes seront partagées dans les 2 ans suivant l'enquête (certaines nécessitent un temps de traitement).

Institut de recherche du Nunavut	will be submitting NRI application for this project very soon	Not Yet Applied		

Project transportation types

Transportation Type	Utilisation proposée	Length of Use
Water	Transit and Research via US Coast Guard cutter Healy	

Project accomodation types

Collectivité

Autre,

Utilisation de matériel

Équipement à utiliser (y compris les perceuses, les pompes, les aéronefs, les véhicules, etc.)

Type d'équipement	Quantité	Taille – Dimensions	Utilisation proposée
3.5 KHz echosounder	1	attached to ship	seabed imaging
USCGC Healy	1	128 m	Research vessel
multibeam echo sounder	1	attached to ship	bathymetric data collection
XCTD	30	0.3 m length	Collect temperature and salinity data while underway
Shipboard sensors for seawater properties	5	attached to vessel	Sensors measure temperature, salinity, dissolved oxygen, total dissolved gas pressure, and chlorophyll fluorescence
acoustic scattering	1	attached to vessel	echo sounder to detect biomass in water (fish finder) at 18KHz and 38 KHz
Acoustic doppler current profiler	2	attached to vessel	measure ocean current velocity
gravimeter	1	attached to vessel	measure Earth's gravity field
Smith McIntyre surface grab sampler	3	0.1 m^2	surface sediment sampling
gravity core	2	max 6m depth x 0.1 m diameter	surfical sediment sampling
Plankton ring net	2	1m^2	vertical tows for sampling and identification of plankton species composition
Multi corer	2	8 simultaneous cores, 1m x 0.1 m diameter	surface sediment and porewater sampling
CTD	10	6 x 10 L bottles per deployment	Collect seawater property data throughout water column, including water samples for shoreside analysis
kovacs ice coring device	2	up to 2 m depth by 0.1m diameter	Collect sea ice samples for analysis of physical, chemical properties (including micro plastics)
hydrophones	1	0.1 m	passive listening of ambient sound, including marine mammal detections, deployed over the side of the vessel or on a small free drifting buoy that is later recovered
small boat	1	6m x 3m	potential deployment to recover hydrophone buoy

Décrivez l'utilisation du carburant et des marchandises dangereuses

Décrivez l'utilisation de carburant :	Type de carburant	Nombre de conteneurs	Capacité du conteneur	Quantité totale	Unités	Utilisation proposée
Diesel	fuel	1	12202915	12202915	Gallons	vessel has diesel electric propulsion and carries all the fuel it needs
ethanol	hazardous	1	1	1	Liters	preservative for plant pigment samples
Mercuric Chloride	hazardous	1	1	1	Liters	Preservative for samples collected to measure seawater pH and alkalinity for ocean acidification studies.
Hydrochloric acid	hazardous	1	1	1	Liters	processing plant pigment and micro plastic samples
Sulfuric acid	hazardous	1	0.5	0.5	Liters	Analyzing oxygen samples
Sodium hydroxide (base)	hazardous	1	0.5	0.5	Liters	analyzing oxygen samples

Consommation d'eau

Quantité quotidienne (m3)	Méthodes de récupération de l'eau proposées	Emplacement de récupération de l'eau proposé
0		

Déchets

Gestion des déchets

Activités du projet	Type des déchets	Quantité prévue	Méthode d'élimination	Procédures de traitement supplémentaires
Scientific/International Polar Year Research	Déchets combustibles	0	All solid waste will be stored onboard for shoreside disposal in Nuuk, Greenland.	Healy garbage management plan attached in supplemental documents

Répercussions environnementales :

no predicted environmental impacts associated with this activity.

Description de l'environnement existant : Environnement physique

Our activities will not impact the physical environment. We will collect small quantities of seabed for sediment analysis. We will collect small quantities of seawater for a suite of analyses designed to understand micro plastics, microscopic plants, and nutrients in seawater. Our ship-based sensor measurements will provide information on seafloor depth and potential navigational hazards in areas that are not well mapped.

Description de l'environnement existant : Environnement biologique

Our intended route has been planned to avoid protected critical habitat for marine mammals, including the Northwester polynya. We will avoid all areas with noted marine mammal presence. We are seeking to employ a local knowledge expert from Kugluktuk or other Nunavut community who will assist with marine mammal sightings to avoid impacts.

Description de l'environnement existant : Environnement socio-économique

Miscellaneous Project Information

documents provided for Healy's garbage management, sewage management, and chemical and hazardous waste management plans

Identification des répercussions et mesures d'atténuation proposées

No anticipated environmental impacts. The vessel complies with all international waste management guidelines and is self-contained with respect to waste.

Répercussions cumulatives

Impacts
