

DÉTAILS

Description non technique de la proposition de projet

Anglais: This project proposes new Hamlet quarry sites within the Arviat municipal boundary. The proposed new quarry/aggregate sites will serve current and future aggregate needs of the Hamlet such as road construction and maintenance, land grading/scaping, and other similar hamlet needs. The quarry/aggregate sites will also be used by various private persons and entities to serve their aggregate needs once they apply to the Hamlet for a quarry permit.

Français: Ce projet propose de nouveaux sites de carrières pour le hameau dans les limites de la municipalité d'Arviat. Les nouveaux sites de carrières et de granulats proposés répondront aux besoins actuels et futurs du hameau en matière de granulats, tels que la construction et l'entretien des routes, le nivellement et l'aménagement du terrain, et d'autres besoins similaires du hameau. Les sites de carrières et de granulats seront également utilisés par diverses personnes et entités privées pour répondre à leurs besoins en granulats une fois qu'elles auront demandé au hameau un permis d'exploitation de carrière.

Autorisations

Organisme de régulation	Description des autorisations	État actuel	Date de l'émission/de la demande	Date d'échéance
Government of Nunavut, Community Government & Services	CGS is the applicant on behalf of the Hamlet of Arviat	Active	2024-01-23	
Hamlets and Municipalities	Hamlet council approved CGS applying for NPC/NIRB approval through council motion # 10/24	Active	2024-01-23	

Project transportation types

Transportation Type	Utilisation proposée	Length of Use
Land	Local and private dump trucks, loaders, excavators, screeners, and crushing machines	

Project accomodation types

Collectivité

Utilisation de matériel

Équipement à utiliser (y compris les perceuses, les pompes, les aéronefs, les véhicules, etc.)

Type d'équipement	Quantité	Taille – Dimensions	Utilisation proposée
CAT Loader	1	5.7m x 2.7m x 1.5m	Excavate quarry material
Dump Truck	1	8m x 2.5m x 3.4m	haul quarry material
Track Excavator	1	10m(L) x 3.2m (H) x 3.2m (W)	excavate quarry material
Screener	1	14.2m(L) x 4m(H) x 4.9m (W)	Screen undesirable aggregate and large boulders

Décrivez l'utilisation du carburant et des marchandises dangereuses

Décrivez l'utilisation de carburant :	Type de carburant	Nombre de conteneurs	Capacité du conteneur	Quantité totale	Unités	Utilisation proposée
Diesel	fuel	1	535	535	Liters	fuel tank that attached to the CAT loader. Diesel will be taken from the community fuel station.
Diesel	fuel	1	567	567	Liters	fuel tank that attached to the Dump Truck. Diesel will be taken from the community fuel station.
Diesel	fuel	1	600	600	Liters	fuel tank that attached to the Track Excavator. Diesel will be taken from the community fuel station.
Diesel	fuel	1	276	276	Liters	fuel tank that attached to the Screener. Diesel will be taken from the community fuel station.

Consommation d'eau

Quantité quotidienne (m3)	Méthodes de récupération de l'eau proposées	Emplacement de récupération de l'eau proposé
0		

Déchets

Gestion des déchets

Activités du projet	Type des déchets	Quantité prévue	Méthode d'élimination	Procédures de traitement supplémentaires
Quarry/Borrow pit	Mort-terrain (sol organique, déchets, résidus)	1,000,000 cubic metres	Overburden will be stockpiled for specific uses as determined by the Hamlet or stored within the quarry sites to be recycled by way of reclamation once the quarry site is depleted of useable material.	NIL

Répercussions environnementales :

The natural vegetation such as moss and other arctic plants on the surface will be disturbed or destroyed within the excavation area within quarry boundaries. This is unavoidable due to the nature of quarry operations. Additional environmental impacts and the mitigation measures are outlined the Spill Contingency and the dust mitigation measures Plans attached to this application.

SECTION B9: Mine Development

SECTION B10: Geology

SECTION B11: Mine

SECTION B12: Mill

SECTION C1: Pits

Any unsuitable overburden material encountered will be stripped from the working area and stockpiled in separate, designated areas, or discarded. Excavation depth will depend on the terrain features but will typically involve digging 1 to 4 metres down from the surface. Proper drainage of the sites will be maintained to ensure medium to large size puddles/ponds do not form. The extraction face will maintain a safe angle to prevent landslides and personnel or public injury. Since each site contains a varying mixture of gravel, sand, and silt; a screener will filter aggregate to its desired specifications. Stockpiling will be permitted within the sites, but such piles will adhere to the restrictions outlined in the Dust Management Plan. All mobile equipment will not refuel on site, but instead will use the local gas station in Arviat. There will be no petroleum stored on site, but a screener and other mobile equipment may be parked overnight. These types of equipment are equipped with diesel tanks. The capacity of each tank is outlined in the Spill Contingency Plan. Prospective site #3 contains a publicly used road. To minimize any hazards or injury to the public, and if the Hamlet deems it necessary, boulders will be placed along the road certain heavy traffic areas within the quarry boundary to prevent traffic from entering the extraction area. The Hamlet has no set operating times regarding quarry extraction but activates usually cease at approximately 9:00PM. This prevents the possibility of traffic collisions during the night when visibility is low. The Hamlet extracts material using their own mobile equipment under an assumed municipal permit, but private individuals and contractors are required to obtain a quarry permit from the Hamlet. Once a permit is obtained, the private individual(s) or contractor(s) extract aggregate to the permitted amount using their own mobile equipment.

Due to limited municipal personnel and resources, supervision of extraction by private individuals or contractors may not occur. Annual extraction quantities are not known due to the sporadic nature of both the public and private sector construction projects. The permit will contain terms and conditions that will require the contractor to follow any conditions imposed by the Nunavut Planning Commission, Nunavut Impact Review Board, The department of Culture & Heritage, or other regulatory authorities. Once the quarry is depleted of useable material, quarry operations cease. Steep slopes will be levelled to a safe angle by the Hamlet. Any ditches will be filled and levelled with the quarry base. All mobile equipment will be removed. Unnatural waste, debris, scrap, and other garbage will be removed. Due to limited capacity and resources, replanting is not feasible.

Description de l'environnement existant : Environnement physique

All sites have similar terrain features and contain vegetation typically found in Nunavut such as moss and other arctic plants. All quarry sites are relatively flat and mostly contain construction grade aggregate. The other areas contain pit-run, sand, and other finer material that have limited uses will be stockpiled. There is a waterbody within prospect #3 with an approximate diameter of 193 metres with unknown marine biology and depth. Another notable narrow waterbody is contained with Prospect #3 with length of 283 metres and a width of 30 metres. The marine biology and depth of unknown. A 31-metre buffer zone will be maintained from the waterbody to ensure they are not disturbed. Prospect #3 contains a public recreational road through the middle that is used by the resident of the community to travel north of the community. The road will be unaltered, although there may be upgrades to certain portions of the road to accommodate heavier traffic. There is no evidence of thermokarst ponds, ice lensing, ground or rock

instability and seismicity within all sites. Surface and bedrock geology, permafrost, and sediment and soil quality for any site is not known.

Description de l'environnement existant : Environnement biologique

All sites contain vegetation typically found in Nunavut such as moss and other arctic plants. There are no wildlife or bird migration routes nor is there any species of concern within any boundary.

Description de l'environnement existant : Environnement socio-économique

Quarry sites C, D, & E contain recreational cabins and a beach area within their boundaries. The Hamlet has not indicated what they plan to do with these sites but aggregate extraction during the early days will avoid and maintain a safe distance from these recreationally used areas. An archeological assessment study will be completed this summer to ensure there are no protected areas within all quarry boundaries. There is no subsistence harvesting, tourism, trapping or guiding operations within the quarry sites. Since both sites are 5 kilometres or further from the community of Arviat, quarry operations by way of the extraction process will minimally affect the well-being of the local residence.

Miscellaneous Project Information

Additional information can be seen in the Dust Management and Spill contingency

Identification des répercussions et mesures d'atténuation proposées

The local Hamlet will be the administrator of all sites. They will be used by both the Hamlet and the public. The Hamlet will issue quarry permits to the public and these quarry permits will come with the following conditions: No extraction of aggregate will occur within 31 metres of any waterbody. The contractor will inform the Hamlet the date and time when they plan to extract the material to ensure the Hamlet, if deemed necessary, supervise the extraction of aggregate. The extraction of aggregate and their surroundings, is done in an environmentally sound manner that is satisfactory to the Hamlet and/or NIRB. Excavation is not to occur outside of the established quarry boundary. Stockpiling of aggregate will be located at least 31 metres from any waterbody to avoid water siltation and obstruction. Access to and from the quarry site will only be done through designated roads. Once extraction of aggregate is complete then the contractor will remove all types of their equipment from the site and slops grade reduction with use of unsuitable stockpiles and uncrushed rocks. The contractor will follow the quarry plans. There will be no petroleum stored on site, but the equipment used in the extraction of aggregate such as loaders and excavators do have diesel tanks attached to them. The Hamlet and private contractors will be required to follow the Spill contingency plan.

Répercussions cumulatives

Since roads to all quarry sites already exists and services recreational traffic to and from Arviat. Any added cumulative effects from quarry operations relating to human activity will be minimal.

Impacts
