## Tukihianaqtunik havaariyauyumayumik uqauhiuyun

Qablunaatitut: This scientific research project led by professor Stephanie Kusch (University of Quebec Rimouski) will investigate changes in permafrost organic carbon remineralization and erosion in response to climate change. Activities performed by a team of 3 university researchers during the duration of the project (yearly sampling in summertime from 2025 to 2028) include permafrost soil sampling to study greenhouse gas production and organic matter transformation as well as sampling of marine sediments to study erosion of permafrost organic carbon into the ocean and oceanic feedback mechanisms. Soil samples will be taken from small 15x15cm soil pits reaching the permafrost table and sediments will be taken using small grab samplers. Samples will be brought back to the laboratory at the University of Quebec Rimouski for direct analysis and long-term incubations in the laboratory. The observations made in this research project will be linked to longer sediment records to understand past permafrost dynamics beyond observational records, which allows assessing the sensitivity and response of permafrost OC to natural climatic as well as anthropogenic forcing and helps predicting the future response of permafrost to climate change. This research will aid the community of Qikiqtarjuaq better understand on-going changes in the environment and their fishing and hunting grounds.

Uiviititut: Ce projet de recherche scientifique dirigé par la professeure Stephanie Kusch (Université du Québec Rimouski) étudiera les changements dans la reminéralisation du carbone organique du pergélisol et l'érosion en réponse au changement climatique. Les activités réalisées par une équipe de 3 chercheurs universitaires pendant la durée du projet (échantillonnage annuel en été de 2025 à 2028) comprennent l'échantillonnage du sol du pergélisol pour étudier la production de gaz à effet de serre et la transformation de la matière organique, ainsi que l'échantillonnage des sédiments marins pour étudier l'érosion du carbone organique du pergélisol dans l'océan et les mécanismes de rétroaction océanique. Les échantillons de sol seront prélevés dans de petites fosses de 15 x 15 cm atteignant la table du pergélisol et les sédiments seront prélevés à l'aide de petites bennes. Les observations faites dans le cadre de ce projet de recherche seront reliées à des enregistrements de sédiments plus longs afin de comprendre la dynamique passée du pergélisol au-delà des enregistrements d'observation, ce qui permettra d'évaluer la sensibilité et la réponse du pergélisol OC aux forçages climatiques naturels et anthropogéniques et aidera à prédire la réponse future du pergélisol au changement climatique. Cette recherche aidera la communauté de Qikiqtarjuaq à mieux comprendre les changements en cours dans l'environnement et dans leurs territoires de pêche et de chasse.

### Avatiliriniqmut Ayurhautingit:

The environmental impact of this project is minimal. Soil pits will be opened with knives and shovels and closed after subsamples have been taken; surface vegetation will be used to close pits, small depressions of the ground (15x15cm) are expected. All soil and sediment samples will be transported back to the laboratory in Rimouski. No treatment of samples on site / no use of chemicals.
