Monumental Island	Researching	Crown	Wilderness site. To the extent of our knowledge, there is no history of research within our proposed sampling area.	None to the extent of our knowledge, recognizing that people have likely crossed and utilized these lands prior to our visit. In the event that sites exist, they will remain undisturbed.	Approximately 250 km east of Iqaluit.
Lady Franklin Island	Researching	Crown	Wilderness site. To the extent of our knowledge, there is no history of research within our proposed sampling area.	None to the extent of our knowledge, recognizing that people have likely crossed and utilized these lands prior to our visit. In the event that sites exist, they will remain undisturbed.	Approximately 250 km east of Iqaluit.
Panniqtuuq	Researching	Municipal	Municipal site. To the extent of our knowledge, there is no history of research within our proposed sampling area.	There is archaeological history in this region (Cumberland Sound) with the long-standing presence of Inuit and their predecessors, such as the Thule culture. History at this site also includes the establishment of whaling in the area in the 1800's, as well as a Hudson Bay Company trading post in the 1900's. Sampling will not occur near or disturb any archaeological or paleontological sites.	The proposed sampling site has proximity to the community of Panniqtuuq (Pangnirtung), while Auyuittuq National Park is approximately 40 km away. However, the proposed sampling at this site is to take place in 3 x 3-meter sampling areas and there is flexibility in site selection as to not cause disruption to the community (as described in the Project Document section, where we have proposed a 50 km sampling radius around each listed coordinate).

Hoare Bay	Researching	Inuit Owned Surface Lands	Wilderness site. To the extent of our knowledge, there is no history of research within our proposed sampling area.	None to the extent of our knowledge, recognizing that people have likely crossed and utilized these lands prior to our visit. In the event that sites exist, they will remain undisturbed.	Approximately 150 km east of Panniqtuuq.
Powell Inlet	Researching	Crown	Wilderness site. To the extent of our knowledge, there is no history of research within our proposed sampling area.	None to the extent of our knowledge, recognizing that people have likely crossed and utilized these lands prior to our visit. In the event that sites exist, they will remain undisturbed.	Approximately 200 km south of Grise Fiord and 200 km north of Arctic Bay.
Beechey Island	Researching	Crown	Wilderness site and National Historic Site of Canada (1993). To the extent of our knowledge, there is no history of research within our proposed sampling area.	This broader site contains the graves of three of Sir John Franklin's expedition members during the Northwest passage expedition, as well as a fourth grave of a later search party member. It also contains the Northumberland House, which was a shelter used for later search parties, among other archeological aspects (cairns, building ruins). Sampling will not occur near or disturb any archaeological or paleontological sites.	Beechey Island is a National Historic Site of Canada, and is located approximately 80 km east of Resolute.
Prescott Island	Researching	Crown	Wilderness site. To the extent of our knowledge, there is no history of research within our	None to the extent of our knowledge, recognizing that people have likely crossed and utilized these lands prior to our	Approximately 200 km south of Resolute.

			proposed sampling area.	visit. In the event that sites exist, they will remain undisturbed.	
Pasley Bay	Researching	Inuit Owned Surface Lands	Wilderness site. To the extent of our knowledge, there is no history of research within our proposed sampling area.	None to the extent of our knowledge, recognizing that people have likely crossed and utilized these lands prior to our visit. In the event that sites exist, they will remain undisturbed.	Approximately 150 km northwest of Taloyoak.
Port Epworth	Researching	Inuit Owned Surface Lands	Wilderness site. To the extent of our knowledge, there is no history of research within our proposed sampling area. In the event that sites exist, they will be undisturbed.	The archeological significance at this site includes the presence of Copper Inuit bands. Sampling will not occur near or disturb any archaeological or paleontological sites.	Approximately 130 km east of Kugluktuk.
Cape Dyer	Researching	Crown	Wilderness site. Although research has been conducted in Cape Dyer, no work has been conducted at our proposed sampling site that would lead to any cumulative effects, to the extent of our knowledge. If so, we will alter our sampling site to ensure this is not the result.	None to the extent of our knowledge, recognizing that people have likely crossed and utilized these lands prior to our visit. In the event that sites exist, they will be undisturbed.	Approximately 200 km northeast of Panniqtuuq. Akpait National Wildlife Area is situated approximately 20 km from our proposed sampling site. Sampling will not occur in this area, nor will it have any effect on this area.
Dundas Harbour	Researching	Crown	Wilderness site and abandoned settlement.	Archeological history includes long-standing Inuit land use, as	Approximately 200 km south of Grise Fiord and 200 km north of Arctic Bay.

			To the extent of our knowledge, there is no history of research within our proposed sampling area.	well as a Hudson Bay Company trading post, an RCMP detachment and a small graveyard. Sampling will not occur near or disturb any archaeological or paleontological sites.	
Port Leopold	Researching	Inuit Owned Surface Lands	Wilderness site and abandoned trading post. To the extent of our knowledge, there is no history of research within our proposed sampling area.	Archeological significance includes an abandoned Hudson Bay Company trading post. Sampling will not occur near or disturb any archaeological or paleontological sites.	Approximately 150 km southeast of Resolute. Prince Leopold Island is a Migratory Bird Sanctuary, located approximately 15 km north of Port Leopold. Sampling will not affect this area.

Spade	1	20 x 100 cm	The spade will be used for digging to collect soil (overlying the permafrost).
Shovel	1	25 x 150 cm	The shovel will be used for digging to collect soil (overlying the permafrost).
Portable 2-stroke engine auger	1	9 cm x 1 meter	The auger will be used to drill permafrost cores where conditions and circumstances allow. The powerhead is an Earthquake E43, 43cc 2-Cycle Viper Engine. The SIPRE core barrel has a diameter of 9 cm and a height of 1 meter. The auger's overall dimensions will be slightly larger to accommodate the engine and frame. Permafrost depth is expected to range from 1 to 2 meters below the surface, with permafrost cores approximately 30 cm in length extracted from each site.

Information is not available				

Avatiliriniqmut Ayurhautingit:

At each site, a small quantity of overlying soil and a small permafrost core will be collected from sampling areas no larger than 3 x 3 meters. While small-scale localized soil and vegetation disturbance may result from this work, dug plots will be narrow to minimize environmental impact, and all sensitive vegetation and wildlife habitats will be avoided during sampling. Any disturbance to the environment will be carefully restored. Soil layers and any vegetation will be kept separate during sampling using various tarps and carefully returned to their original positions post-sampling. All equipment will be cleaned between each site to prevent the introduction of non-native species or microorganisms into new sampling areas. Our sole community sampling location is in Panniqtuuq. If granted permission to sample here, site selection and sampling methods will be chosen as to not cause disruption, and we will work with community members to ensure local knowledge is respected.

Qanurittuq Ittunik Avatinga: Avatingalluanga

The Project Activities section in this form best describes the proximity of each proposed terrestrial sampling site to protected areas and communities, as well as their linked cultural and historical significance. All proposed sampling sites, apart from the community of Panniqtuuq, are remote and uninhabited. Throughout the duration of sampling there will be no access to roads/trails, nor will the work occur in designated environmental areas, such as parks, in protected areas, heritage areas, cultural areas, sensitive environmental or geological areas (e.g., eskers or unique landscapes), or in disruption with wildlife species and their habitats (including breeding/spawning areas, migration routes, etc.). Sampling will also avoid recreational areas, community use areas, as well as those used for fishing and hunting. This work will not have any contact with water or aquatic ecosystems, and if lakes, streams, etc. are encountered, sampling will not proceed near these areas. Marine use will only apply to accessing land from the ship, for which Adventure Canada has permitting approval. Noise will be very minimal, as the auger is expected to run for no longer than one minute at each site, and will have no effect on air quality. Climate impacts resulting directly from this research will also be very minimal, while this work will generate data to aid in future climate modelling in each area. The topography at each site will vary. Adventure Canada has not yet accessed all these sites, and therefore the exact topography at each location cannot be accurately described at this time. However, sampling is aimed to occur in plains and valleys, where the ground is flat and most conducive to soil and permafrost collection. There may be eskers, wetlands, or other unique landscapes present, although sampling will not occur within these landforms. Permafrost will be accessed, although the exact stability, depth, thickness, and continuity will likely vary across the proposed sites and is to be determined and recorded during field work (depth is expected to range from one to two meters). Exposure of permafrost may have small-scale climate impacts; however, careful restoration of each site will be carried out using the original overlying soils to protect permafrost layers. The active soil layer (above the permafrost) will also be accessed, where solid bedrock, large sediments, and unstable rock will be avoided. Soil quality is expected to reflect that of the Arctic tundra: nutrient-poor and varied in moisture content. It is not expected that there will be thermokarsts or ice lenses, but in the case that there are, these areas will be avoided and undisturbed during sampling, as well as documented. Concerning sampling in the community of Panniqtuuq, we have reached out to Anita Evic at the Hamlet of Pangnirtung regarding employment opportunities for community members on the day of sampling, as well as to work with community members to identify aspects of the physical environment locally and choose the most appropriate sampling site that avoids any environmental and cultural areas of note. Overall, within these proposed locations, there is flexibility in choosing a suitable and appropriate sampling site. All sensitive areas will be cautiously avoided during site selection (i.e., trails, areas of biological interest, natural features such as streams, etc.) and we are looking to take our sample from an area that is representative of the physical environment, and to not disrupt any part of the environment that is unique or fragile. No structures are to be erected in the area, and there will be no use of water or creation of waste. Transportation while on land will be by foot. Sampling conducted by Gwen will take no longer than 2 hours at each site.

Qanurittuq Ittunik Avatinga: Inuuhimayunut Avatinga

The biological environment surrounding the proposed sampling sites, includes the terrestrial tundra vegetation, as well as wildlife. Considering that the proposed sampling sites are at different locations, each area is expected to harbour unique wildlife and vegetation. Vegetation includes mosses, lichens, shrubs and grasses. Vegetation presence may vary, with some sites harbouring sparse plant life. Sampling will occur in vegetation-poor sites when present, and vegetation will be avoided to the best of our abilities. Terrestrial wildlife in the area includes polar bears, seals, walrus, foxes, voles, and lemmings. Wildlife, including habitat and migratory areas, will be avoided in site selection. Birds present in these areas include thick-billed murre, terns, and gulls, among others. This work will not impact birds, including their habitat (especially ground nesting) and migration patterns. Species at risk, including those of terrestrial wildlife (e.g., polar bears) and birds (e.g., species of gull) will not be impacted by this work, as their populations and habitats will be completely and carefully avoided as described above. Adventure Canada has chosen these locations with careful consideration to not inflict harm on wildlife, vegetation, or bird species. If sampling will cause harm to any of these biotic aspects of the environment, sampling in that area will not proceed.

Qanurittuq Ittunik Avatinga: Inungit-maniliurutingit Avatinga

The associated proximities of sampling sites to communities, archaeological sites, and culturally significant sites are described in the Project Activities section in this form. When present, archaeological sites will be avoided and left undisturbed. Paleontological sites are likely to be present within the areas we are visiting; however, this work will not result in the disturbance of bedrock or its excavation and therefore will aid in the avoidance of these sites. As with most places in the north, there is likely to have been land use by Inuit for centuries, and as such, caution will be used when proceeding with site selection and sampling. In travelling with Adventure Canada, there will be a resource team of scientists and local Nunavut residents onboard, who Gwen will consult prior to sampling regarding any possible archaeological or paleontological sites, as well as culturally significant areas to be avoided. Land and resource use is applicable in the community of Panniqtuuq, where there is tourism, such as from ship visits (similar to that of Adventure Canada), as well as harvesting and trapping. This work is expected to have no impact on the socioeconomic environment of the locations visited, apart from providing employment and educational opportunities, should there be interest, on the day of sampling in Panniqtuuq. Our goal is to work with the community of Panniqtuuq to ensure we do not inflict disruption to their land and resources. Furthermore, we hope this work will positively impact local community members and create a space to share knowledge and stories. Local and regional traffic patterns will not be affected, as site access is by foot.

Miscellaneous Project Information

Fuel Contingency Plan attached in Project Documents. A proposed 50 km sampling radius around each of the listed coordinates is attached in Project Documents. The operational dates are from August 5th to September 1st, 2025.

Naunaiyainiq ukuninnga Ayurhautingit unalu Piumayaat Iikikliyuumiutinahuarutit

Impacts are identified in the Impacts tab on this application, and includes both permafrost and vegetation, both as mitigable. Permafrost and vegetation will be disturbed at a very small scale, and these effects will be mitigated through limiting sampling area and resource collection, as well as through careful restoration of each sampling site. Any sensitive vegetation will also be avoided during sampling. The Impacts tab further details our proposed mitigation strategies for any negative effects. There will be no transboundary effects as this research is localized and will not cause greater harm, and there will be no adverse effects to species under the Species at Risk Act and their habitats, as these species and their habitats will be avoided during sampling. There is flexibility in sample site selection, which further allows the avoidance of sensitive areas and enables us to carefully choose the most appropriate sampling site. As stated previously, aboard the Adventure Canada vessel there will also be a resource team of scientists and local Nunavut residents. We will consult with these individuals prior to site selection and sampling regarding any possible environmental concerns in the area. If there are environmental concerns, sampling will not occur. As above, this work is expected to have no negative socioeconomic impacts on the locations visited. Longer term, this data will allow better prediction of greenhouse gas emissions from permafrost, and how local environmental factors may influence carbon flux in different Arctic regions. We hope this will improve climate modelling, and in turn aid in supporting climate resilience planning for northern communities. Furthermore, we will discuss our research with the passengers travelling with Adventure Canada to raise awareness for northern communities experiencing the effects of climate change in their local environments. Our aim is to create increased global advocacy for Nunavut communities navigating the future of climate

warming in the Arctic.

Tamatkiumayunik Ihuikgutivaktunik

There will be no cumulative effects resulting from this work.
