QANURITTUT

Tukihiannaqtunik havaariyauyumayumik uqauhiyun

Qablunaatitut: Ongoing environmental and anthropogenic changes in the Canadian Arctic have raised concerns regarding the capacity of marine mammal populations to adapt to these new and expanding stressors. In order to assess and mitigate potential impacts from stressors like climate change and the expansion of high Arctic marine shipping activities, a better understanding of contemporary marine mammal stocks, behaviour, and movements in the Canadian High Arctic is needed. Efforts will focus on narwhal (*Monodon monoceros*) and beluga whale (*Delphinapterus leucas*) populations in the Gulf of Boothia and Cumberland Sound, NU during summer and fall. Killer (*Orcinus orca*) and bowhead (*Balaena mysticetus*) whales are also known to inhabit these areas in summer and may be opportunistically sampled as part of this research program. This study will use remotely-piloted aircraft (drones) to collect photographs and video to assess population structure (i.e. age, sex), body condition and behaviour of individuals and groups of whales. Photos will contribute to ongoing photo-identification studies and population abundance estimates. Videos will be used to assess dive behaviour and group dynamics. Additionally, drones will be used to collect blow samples for hormone and genetic analysis. We will use remote tissue biopsy sampling methods to assess genetic relationships, hormone levels, and diet of Arctic whales. Biopsy tissue samples will be collected using custom crossbows, air rifles, and drone-deployed methods. GPS satellite tags will be applied to adult whales to monitor summer movements and provide information on dive behaviour. Location and movement data will be used to monitor behaviour, habitat use, and seasonal migrations. Dive information (time spent at the surface vs. at depth) will be used to inform correction factors to improve population estimates derived from recent aerial surveys conducted throughout the Arctic. Methods will employ least-invasive techniques and technologies to minimize stress on whales and achieve project goals. Drone operations will be led by licensed and experienced pilots and will follow approved standard operating procedures for operating drones near marine mammals. Biopsy sampling and tagging will use remote sampling methods and utilize small boats and drones to deploy biopsy darts and tags on the water or from land. Only trained and experienced operators will be responsible for tagging/biopsy efforts. No animals will be captured or handled during this study. Field studies in Cumberland Sound will be based from the community of Pangnirtung and carried out by two Nunavut Beneficiaries hired through the Pangnirtung Hunters and Trappers Association. Research in the Gulf of Boothia will be carried out by two to four Nunavut Beneficiaries hired through the Taloyoak Umarulirigut Association. Two Fisheries and Oceans (DFO) staff will accompany the Gulf of Boothia field team during the initial onset of the field work in 2025. Work will be based from a local Inuit hunting camp in Lord Mayor Bay (Lat. 69.661422 Long. -92.671292) for a period of 3-4 weeks in summer. Field crews will rent local Inuit-owned cabins for lodging and Inuit-owned small boats (< 10 m length) with experienced Inuit boat operators familiar with the local environment and marine mammal behaviour. Crews will operate daily excursions from the base camp when weather permits. Project Schedule: Cumberland Sound: 01-Jun-2025 to 01-Dec-2025 Gulf of Boothia: 01-Aug-2025 to 01-Nov-2025

Uviititut: Déplacements et génétique des baleines dans l'Arctique canadien grâce à la télémétrie par satellite, aux biopsies tissulaires et à la photogrammétrie Description du projet : Les changements environnementaux et anthropiques en cours dans l'Arctique canadien soulèvent des inquiétudes quant à la capacité des populations de mammifères marins à s'adapter à ces nouveaux facteurs de stress en pleine expansion. Afin d'évaluer et d'atténuer les impacts potentiels de facteurs de stress tels que les changements climatiques et l'expansion du transport maritime dans l'Extrême-Arctique, une meilleure compréhension des stocks, du comportement et des déplacements actuels des mammifères marins dans l'Extrême-Arctique canadien est nécessaire. Les efforts porteront sur les populations de narvals (*Monodon monoceros*) et de bélugas (*Delphinapterus leucas*) du golfe de Boothia et de la baie Cumberland, au Nunavut, en été et en automne. L'épaulard (*Orcinus orca*) et la baleine boréale (*Balaena mysticetus*) sont également présents dans ces zones en été et pourraient être échantillonnés de manière opportuniste dans le cadre de ce programme de recherche. Cette étude utilisera des drones pour prendre des photos et des vidéos afin d'évaluer la structure de la population (âge, sexe), l'état corporel et le comportement des baleines, qu'elles soient individuelles ou en groupe. Les photos contribueront aux études de photo-identification en cours et aux estimations de l'abondance de la population. Les vidéos

Avatiliriniqmut Ayurhauingit:

Research in Cumberland Sound will be conducted by daily boat excursions from Pangnirtung when weather permits and whales are reported in the sound. Environmental impacts will be limited to typical operation of a small vessel in a marine environment and are considered negligible. Similarly, research in the Gulf of Boothia will be largely marine-based requiring the operation of small, gasoline powered vessels. Environmental impacts associated with these activities are considered negligible. Environmental impacts associated with the temporary field camp in Lord Mayor Bay will be mitigated by setting up within the footprint of an existing Inuit hunting camp. All garbage/waste produced during the program will be removed at the end of the program and returned to Taloyoak for proper disposal.

Qanurittuq Ittunik Avatinga: Avatingalluanga

Field research activities will be marine-based. Research within Cumberland Sound will be community based with day trips from Pangnirtung by boat. No terrestrial activities are planned for this region. Narwhal, beluga, bowhead, and occasionally killer whales are known to migrate through the sound during summer. The Cumberland Sound beluga population is currently listed as "Threatened" under the federal Species at Risk Act. Areas within the northern extent of the sound, particularly within Clearwater Fiord, are known to provide important habitat for beluga whales during the open water season. More information is required to further understanding of the dynamics and health of this population to inform conservation and management decisions. Research conducted in the Gulf of Boothia will focus on the Baffin Bay narwhal population, known to access this area during the summer months. Bowhead whales also frequent this area during the summer months and will be opportunistically sampled as part of this program. Access to the Gulf of Boothia will follow existing transportation routes by boat through a series of freshwater lakes and overland portages from Taloyoak to Lord Mayor Bay. Research crews will use a temporary camp setup in an existing Inuit hunt camp on Lord Mayor Bay and will work with the local hunters to conduct research. Research activities will be marine-based with day trips from the camp to accessible areas within the bay.

Qanurittuq Ittunik Avatinga: Inuuhimayunut Avatinga

Cumberland Sound is a large ~300km long inlet on the southeast corner of Baffin Island in the Qikiqtaaluk Region, Nunavut. The coastline is marked by steep, rocky cliffs and characteristic deep, clear waters. The sound provides valuable seasonal habitat for whales during the summer months. Narwhal, beluga, bowhead, and occasionally killer whales migrate through this area in summer to carry out various ecological activities. These whales provide important subsistence foods for local residents of Pangnirtung, the only permanent settlement on the sound. The Gulf of Boothia is a large, uninhabited area divided by the Kitikmeot (west) and Qikiqtaaluk (east) Regions of Nunavut. This area provides rich marine diversity and provides valuable habitat for whales migrating through the area in summer. Community members from Taloyoak, located approximately 40 km southwest, traditionally use this area for subsistence harvesting marine mammals and migratory birds during the spring and summer. Studies based in Lord Mayor Bay, the easternmost extent of the gulf, will be coordinated with the assistance of local hunters and will include a temporary field camp established within an existing Inuit hunting camp.

Qanurittuq Ittunik Avatinga: Inungit-maniliurutingit Avatinga

Both study areas support subsistence harvest of marine mammals and some sport hunting and tourism activities. Cumberland Sound also supports a growing commercial turbot fishery for residents of Pangnirtung. As previously stated, Cumberland Sound provides seasonal marine habitat for the Cumberland Sound beluga population which is currently listed as "Threatened" under the federal Species at Risk Act.

Miscellaneous Project Information

Naunaiyainiq ukuninnga Ayurhautingit unalu Piumayaat Ikiykiuumiutinahuarutit

This research will have negligible socioeconomic or environmental impacts. Some temporary disturbance and/or discomfort may be experienced by whales that are targeted for tagging/biopsy sampling, however, no long-term effects are expected. Environmental impacts will be limited to typical operation of a small vessel in a marine environment and are considered negligible. All project related materials will be removed from site at the end of the program.

Tamatkiumayunik Ihuikgutivaktunik

This research will have positive socioeconomic and environmental benefits to Nunavut. This project will provide employment and training opportunities to Nunavut beneficiaries which will lead to future projects and community-led research initiatives. This research will also provide much needed information on Arctic whale ecology which will help support conservation efforts and management objectives. Information gathered will be shared with local Hunters and Trappers organizations, local governments, knowledge keepers, and local residents through community engagement and in-person and virtual meetings.
