QANURITTUT

Tukihiannaqtunik havaariyaumayumik uqauhiyun

Qablunaatitut: The Iqaluit Nukkiqsautiit Project (INP) is an Inuit-led renewable energy project. It proposes to build a hydroelectric power facility in the Kuugaluk River system on the Hall Peninsula. The Project is led by the Nunavut Nukkiqsautiit Corporation (NNC), a 100% Inuit-owned clean energy company. The goal of the Project is to provide a reliable source of renewable electricity for Iqaluit and to reduce the use of diesel fuel brought in from outside Nunavut. The Project would include a hydroelectric facility with a planned power capacity of about 15 megawatts (MW). Electricity would be produced by storing water from an existing lake and river system and releasing it through turbines. The main parts of the Project would include a dam, a reservoir, and a powerhouse with turbines and generators. Other water control structures, such as spillways and intake structures, would help manage water levels and flows. The reservoir is expected to cover about 7,300 hectares, and water levels would be managed to support power generation while allowing water to continue flowing downstream. Other Project infrastructure would include about 65 kilometres of new all-season access roads, smaller roads within the Project area, and a 66-kilometre transmission line to carry electricity to Iqaluit. A new substation near Iqaluit would connect the power to the existing electrical system. Temporary facilities, such as seasonal camps, work areas, and material borrow sites, would be needed during study and construction work. These temporary areas would be removed or restored once they are no longer needed. At this time, the Project is still in the planning stage. The exact size, location, and design of Project components are being finalized. Details such as road routes, construction methods, water management plans, and operating rules will be updated as more engineering work, environmental studies, and Inuit engagement are completed. The Project is currently completing environmental, socio-economic and technical studies. These studies look at water flow, water quality, fish and wildlife, permafrost, and ground stability. The information collected will help prepare future environmental reports, including an Environmental Impact Statement (EIS), and will help improve Project design and safety measures. The Project is being reviewed under the Nunavut Planning and Project Assessment Act (NuPPAA). It requires review by the Nunavut Planning Commission and screening by the Nunavut Impact Review Board (NIRB). Based on current information, the Project does not require a federal impact assessment. Federal permits will still be needed for specific activities, such as work in water or near navigable waters. If the Project is approved and built, it could greatly reduce diesel use in Iqaluit, lower greenhouse gas emissions, and improve long-term energy security. The Project would also support Inuit jobs, training, and business opportunities. NNC will continue to work with Inuit communities, regulators, and partners to make sure the Project reflects Inuit values, protects the environment, and meets territorial priorities.

Uviititut: Le projet Iqaluit Nukkiqsautiit (INP) est un projet d'énergie renouvelable mené par les Inuit [RD1.1]. Il propose la construction d'une centrale hydroélectrique dans le réseau hydrographique de la rivière Kuugaluk, sur la péninsule Hall. Le projet est dirigé par la Nunavut Nukkiqsautiit Corporation (NNC), une entreprise d'énergie propre détenue à 100 % par les Inuit. L'objectif du projet est de fournir une source fiable d'électricité renouvelable à Iqaluit et de réduire l'utilisation de carburant diesel importé de l'extérieur du Nunavut. Le projet comprendrait une centrale hydroélectrique d'une puissance prévue d'environ 15 mégawatts (MW). L'électricité serait produite en stockant l'eau provenant d'un lac et d'un réseau fluvial existants et en la libérant à travers des turbines. Les principaux éléments du projet comprendraient un barrage, un réservoir et une centrale électrique équipée de turbines et de générateurs. D'autres ouvrages de contrôle des eaux, tels que des déversoirs et des prises d'eau, aideraient à gérer les niveaux et les débits d'eau. Le réservoir devrait couvrir environ 7 300 hectares, et les niveaux d'eau seraient gérés de manière à permettre la production d'électricité tout en laissant l'eau continuer à s'écouler en aval. Les autres infrastructures du projet comprendraient environ 65 kilomètres de nouvelles routes d'accès toutes saisons, des routes plus petites dans la zone du projet et une ligne de transport d'électricité de 66 kilomètres pour acheminer l'électricité vers Iqaluit. Une nouvelle sous-station près d'Iqaluit permettrait de raccorder l'électricité au réseau électrique existant. Des installations temporaires, telles que des camps saisonniers, des zones de travail et des sites d'emprunt, seraient nécessaires pendant les travaux d'étude et de construction. Ces zones temporaires seraient supprimées ou restaurées dès qu'elles ne seraient plus nécessaires. À l'heure actuelle, le projet en est encore au stade de la planification. La taille, l'emplacement et la conception exacts des composantes du projet sont en cours de finalisation. Les détails
