ᖃᓕᓗᓀᑎᑐᑦ: Bayridge Resources Corp. is proposing a single-season, exploration-only mineral exploration program at the Baker Lake Project, located approximately 65 km southeast of Baker Lake (Qamani'tuaq), Nunavut. Activities are planned for June 20 to September 10, 2026 (up to 100 days), subject to regulatory approvals.The proposed program includes early-stage exploration such as geological mapping, prospecting, ground-based radiometric surveys, verification of historic drill hole locations, and review of historic drill core. Subject to permit approval and early-stage results, up to 3,500 metres of diamond drilling may be completed. No bulk sampling, ore extraction, mineral processing, mine development, or permanent infrastructure is proposed.The project will operate on a daily fly-in / fly-out basis from Baker Lake using fixed-wing and rotary-wing aircraft. Personnel will stay in commercial accommodations in Baker Lake. One small, temporary exploration outpost may be established at a previously disturbed historic site to support drilling activities. The outpost will consist of temporary fuel storage with secondary containment and canvas tents for core logging, emergency shelter, and equipment storage. All infrastructure will be temporary and removed at the end of the season, and disturbed areas will be reclaimed.The project is designed to minimize environmental effects through established management plans addressing wildlife protection, spill response, waste management, and reclamation. Activities will avoid sensitive wildlife areas, incorporate adaptive measures if caribou are present, and follow applicable setback requirements from waterbodies. The proponent will continue engagement with the Hamlet of Baker Lake, the Hunters and Trappers Organization, and the Kivalliq Inuit Association throughout project planning and implementation.

ᐅᐃᕕᑎᑐᑦ: Bayridge Resources Corp. propose un programme d'exploration minérale à durée limitée au projet Baker Lake, situé à environ 65 km au sud-est de Baker Lake (Qamani'tuaq), au Nunavut. Les activités sont prévues du 20 juin au 10 septembre 2026 (jusqu'à 100 jours), sous réserve des approbations réglementaires.Le programme comprend des travaux d'exploration préliminaires tels que la cartographie géologique, la prospection, des levés radiométriques au sol, la vérification d'anciens forages et l'examen de carottes historiques. Sous réserve des permis requis et des résultats obtenus, jusqu'à 3 500 mètres de forage au diamant pourraient être réalisés. Aucun échantillonnage en vrac, aucune extraction de minerai, aucun traitement minéral ni infrastructure permanente ne sont proposés.Le projet fonctionnera selon un modèle d'aller-retour quotidien à partir de Baker Lake par avion à voilure fixe et hélicoptère. Le personnel sera logé dans des installations commerciales à Baker Lake. Un petit poste d'exploration temporaire pourrait être établi sur un site historique déjà perturbé afin de soutenir les travaux de forage. Toutes les installations seront temporaires et retirées à la fin de la saison, et les sites perturbés seront remis en état.Le projet sera mis en œuvre conformément aux plans de gestion environnementale applicables, incluant la protection de la faune, la gestion des déchets, la prévention des déversements et la remise en état.

Temporary Exploration Outpost – 2026 Season	Mineral Exploration	Crown	Temporary staging location at a previously disturbed historic exploration site. Will include fuel storage with secondary containment and temporary tents. All equipment and materials removed at end of season.	No known archaeological or paleontological sites identified. Standard chance-find procedures will be followed.	Within broader exploration area approximately 65 km southeast of Baker Lake.
2026 Exploration and Drilling Activity Area – Crown Land	Mineral Exploration	Crown	Area has been subject to historic mineral exploration including previous drilling and surface disturbance. Proposed 2026 activities include mapping, prospecting and up to 3,500 m of diamond drilling. Final drill collar locations may be adjusted in the field within the mapped exploration area based on geological and environmental considerations. No permanent infrastructure will be established.	No known archaeological or paleontological sites have been identified within the activity area. If artifacts or features are encountered, work will cease and appropriate authorities will be notified.	Located approximately 65 km southeast of Baker Lake. No National Parks or designated protected areas are known to occur within the immediate project footprint.

Mineral Exploration	ᐃᒪᐃᑦ ᐊᑐᖅᑕᐅᔭᕆᔨᒃᑯᒪᔨᑦ	5 m³/day (outpost max)	Managed in excavated sump located minimum 31 m from waterbody, allowing natural infiltration.	Sump backfilled and restored following use.
Drilling	ᐊᑦᑕᓇᖅᑐᖅ	Project dependent (limited)	Stored in sealed, labeled containers and backhauled by licensed carrier to accredited disposal facility.	Mineralized drill cuttings exceeding radiometric thresholds will be disposed of downhole and grouted where feasible.
Mineral Exploration	ᐊᑲᑕᑯᑦ ᐃᑯᐊᓪᑕᐅᔨᓐᓇᖅᓯᒪᓕᒃᑐᑦ	Project dependent (limited)	Segregated, packaged, and backhauled to approved recycling or disposal facility.	Stored in sealed containers within designated storage area to prevent wildlife access.
Drilling	Other, Drill cuttings and drill water	Up to 20 m³/day (recirculated water)	Contained within drill sump; solids allowed to settle; water recirculated where feasible.	Sump located minimum 31 m from waterbody and reclaimed after drilling.
Mineral Exploration	ᖁᑯᖅᑕᓪᓚᓂᖅ	Minimal	Stored in sealed cartridges and backhauled to approved facility in Baker Lake.	No on-site discharge.

ᐊᐸᑎᑭᐅᑕᓂᒃᑐᑦ ᐊᑐᖅᑕᐅᔭᕆᔨᒃᑯᑦ

The proposed 2026 exploration program is a temporary, small-scale activity of limited duration (up to 100 days) with a maximum of six personnel on site. Predicted environmental interactions include localized ground disturbance at drill sites, temporary noise associated with aircraft and drilling, limited water withdrawal for drilling purposes (up to 20 m³/day), temporary fuel storage, and generation of waste

materials. Mitigation measures include heli-portable drilling to minimize disturbance, 31-metre setbacks from waterbodies, screened water intakes, secondary containment for fuels and hazardous materials, implementation of an approved Spill Contingency Plan, proper waste segregation and backhaul, and progressive reclamation of drill sites and sumps. Adaptive measures will be implemented if caribou or other sensitive wildlife are present. All infrastructure will be temporary and removed at the conclusion of the field season.

ᒫᓐᓇ ᐊᕙᑎᐅᑉ ᖃᐅᐃᑦᑐᓪᓚᕆᐅᓂᖓ: ᓄᓇᐅᑉ ᖃᐅᐃᑦᑑᓂᖓ

The project area is located approximately 65 km southeast of Baker Lake within the Kivalliq region of Nunavut. The terrain is characteristic of the central Canadian Shield and consists of low-relief bedrock outcrops, thin glacial till, tundra vegetation, wetlands, and numerous small lakes and ponds. Surface water features are abundant and include interconnected freshwater systems typical of sub-Arctic landscapes. The region is underlain by discontinuous permafrost. Active layer depths vary seasonally, and care will be taken to minimize ground disturbance in order to protect surface stability. There are no permanent structures within the immediate project footprint. Historic exploration disturbances are present in localized areas. Climate conditions are typical of the sub-Arctic, with short summer field seasons, variable precipitation, and strong seasonal freeze-thaw cycles. Exploration activities will be conducted during the summer field season to reduce potential impacts associated with snow cover and frozen ground conditions.

ᒫᓐᓇ ᐊᕙᑎᐅᑉ ᖃᐅᐃᑦᑐᓪᓚᕆᐅᓂᖓ: ᐆᒪᔪᖅᑕᖃᕐᓂᖓ

The project area supports typical tundra and freshwater ecosystems of the Kivalliq region. Vegetation consists primarily of low-growing shrubs, lichens, mosses, sedges, and grasses adapted to sub-Arctic conditions. Wildlife species known to occur in the broader region include barren-ground caribou, small mammals, migratory birds, raptors, and freshwater fish species. Caribou are an important ecological and cultural species in the region, and seasonal movement patterns may overlap with portions of the project area. Freshwater bodies within and surrounding the project area may support fish species common to the region. No designated protected areas or National Parks occur within the immediate project footprint.Exploration activities will be planned and conducted with consideration for wildlife presence, including adherence to setback distances from waterbodies and implementation of adaptive measures should sensitive wildlife be observed.

ᒫᓐᓇ ᐊᕙᑎᐅᑉ ᖃᐅᐃᑦᑐᓪᓚᕆᐅᓂᖓ: ᐃᓄᓕᕆᓂᕐᑑᖓᔪᑦ-ᐱᕙᓪᓕᐊᔪᓕᕆᓂᕐᑑᖓᔪᑦ

The project is located within the Kivalliq region of Nunavut, with Baker Lake serving as the nearest community and logistical base. Baker Lake is a predominantly Inuit community with a mixed wage-based and land-based economy. Employment opportunities are primarily associated with government services, education, health care, local businesses, and seasonal resource development activities.Residents of Baker Lake continue to rely on traditional land use practices including hunting, fishing, and harvesting, particularly with respect to caribou and freshwater resources. Community members maintain strong cultural and subsistence connections to the surrounding land and water.The proposed 2026 program is an early-stage, exploration-only activity of limited duration (up to 100 days) and modest workforce size (maximum six personnel on site). No permanent infrastructure, processing facilities, or long-term site occupation is proposed. Socioeconomic interactions are therefore anticipated to be short-term and primarily associated with seasonal field operations.Bayridge Resources Corp. intends to provide opportunities for local participation where feasible, including hiring of wildlife monitors, field assistants, translation services, and

local logistical support. Engagement with the Hamlet of Baker Lake and local organizations is ongoing to ensure that activities are conducted in a manner respectful of community priorities and land use.

Miscellaneous Project Information

Community engagement for the proposed 2026 exploration program began in early January 2026. Initial notification was provided to the Hamlet of Baker Lake, followed by phone discussions and an in-person meeting with the Senior Administrative Officer during a visit to Baker Lake from January 16–21, 2026. The proposed early-stage exploration activities were discussed, and guidance was sought regarding appropriate community engagement steps.Based on discussions with the Hamlet, Bayridge Resources Corp. committed to returning to Baker Lake to host a public community information session. Representatives of Bayridge will be in Baker Lake from March 9–13, 2026, and a public drop-in information session is scheduled for March 11, 2026 (6–8 PM) at the community hall. An interpreter has been requested to support accessibility.The Baker Lake Hunters and Trappers Organization and the Kivalliq Inuit Association have also been notified of the proposed program. Bayridge remains committed to ongoing engagement and will continue communication prior to and during the 2026 field season. A summary of engagement feedback will be considered in final operational planning, where appropriate.

ᓇᓗᓇᐃᖅᑕᐅᓂᖏᑦ ᐊᒃᑐᖅᑕᐅᓯᒪᔪᑦ ᖃᓄᐃᑦᑑᓂᖏᑦ ᐸᓚᐅᒥᕝᔪᓯᖅᑕᐅᓂᐊᕐᓂᖏᓪᓗ

The proposed 2026 exploration program is a temporary, small-scale activity of limited duration (up to 100 days) with a maximum of six personnel on site. Predicted environmental interactions include localized ground disturbance at drill sites, temporary noise associated with aircraft and drilling activities, limited water withdrawal for drilling purposes (up to 20 m^3/day), temporary fuel storage, and the generation of solid and hazardous waste materials. Mitigation measures include the use of heli-portable drilling equipment to minimize ground disturbance, adherence to applicable setback distances from waterbodies, screened water intakes to prevent fish entrainment, secondary containment for fuels and hazardous materials, implementation of an approved Spill Contingency Plan, proper waste segregation and backhaul to licensed facilities, and progressive reclamation of drill pads and sumps. Aircraft operations will maintain practical flight altitudes and avoid unnecessary low-level flying where feasible, except during take-off, landing, and drill moves. Adaptive measures will be implemented if caribou or other sensitive wildlife are observed in the vicinity of flight paths or project activities. All infrastructure will be temporary and removed at the conclusion of the field season, and disturbed areas will be stabilized in accordance with established reclamation practices.

Cumulative Effects

The proposed 2026 exploration program is a short-term, small-scale activity with a limited spatial footprint and no permanent infrastructure. Activities are confined to existing mineral claims and, where feasible, previously disturbed areas. Given the temporary nature of the program and the implementation of established mitigation measures, the incremental contribution of this project to cumulative effects, when considered in combination with other existing or reasonably foreseeable activities in the region, is expected to be low and localized. The project does not involve mine development, mineral processing, permanent camps, or long-term land use changes. Progressive reclamation will occur during the field season, and all temporary infrastructure will be removed upon completion of activities. Ongoing engagement with local organizations and adherence to regulatory requirements will support coordination with other regional land users, where applicable.
