DÉTAILS

Description non technique de la proposition de projet

Anglais: NOTE : The snow sampling component of the project has been cancelled due to the postponement of the expedition. As a result, no snow will be collected. The activity is now limited to a ski traverse and camping along the route. The project will be carried out by two people. Camping equipment includes a polar expedition tent (approximately 4 metres in diameter). The team will travel entirely by ski and carry all equipment in sleds. Fuel requirements are limited to standard gasoline, which will be purchased locally in Nunavut and transported in two fuel jerrycans. This fuel will be used exclusively for cooking and basic camp needs. No machinery will be used during the expedition. There will be no generators or motorised equipment. Energy needs will be covered by portable solar panels used for small electronic devices (navigation, communication, cameras). No sampling equipment will be carried, as the scientific component related to snow collection has been removed from the project.

Français: NOTE : Le volet de prélèvement de neige du projet a été annulé en raison du report de l'expédition. Par conséquent, aucun échantillon de neige ne sera collecté. L'activité se limite désormais à une traversée à ski et au camping le long de l'itinéraire. Le projet sera mené par deux personnes. L'équipement de camping comprend une tente d'expédition polaire (d'environ 4 mètres de diamètre). L'équipe se déplacera entièrement à ski et transportera l'ensemble du matériel dans des pulkas. Les besoins en carburant se limitent à de l'essence standard, qui sera achetée localement au Nunavut et transportée dans deux jerricans. Ce carburant sera utilisé exclusivement pour la cuisson et les besoins de base au camp. Aucune machinerie ne sera utilisée durant l'expédition. Il n'y aura ni générateurs ni équipements motorisés. Les besoins énergétiques seront couverts par des panneaux solaires portables, utilisés pour alimenter de petits appareils électroniques (navigation, communication, caméras). Aucun équipement d'échantillonnage ne sera transporté, puisque le volet scientifique lié au prélèvement de neige a été retiré du projet.

Nunavut Planning Commission	NPC File # 150962. The NPC has completed its review of the above noted project proposal. It conforms to the North Baffin Regional Land Use Plan (NBRLUP).	Active	2026-02-04	

Project transportation types

Transportation Type	Utilisation proposée	Length of Use
Air	We will take a plane from Iqaluit to Clyde River, and Pangnirtung and Iqaluit.	
Land	We will ski.	

Project accommodation types

Temporary Camp

Utilisation de matériel

Équipement à utiliser (y compris les perceuses, les pompes, les aéronefs, les véhicules, etc.)

Type d'équipement	Quantité	Taille – Dimensions	Utilisation proposée
Glass container	10	10x10cm	Use of glass containers to collect a few centimeters of surface snow. We are not going to dig.

Décrivez l'utilisation du carburant et des marchandises dangereuses

Décrivez l'utilisation de carburant :	Type de carburant	Nombre de conteneurs	Capacité du conteneur	Quantité totale	Unités	Utilisation proposée
Gasoline	fuel	2	20	40	Liters	Using fuel for our stove.

Consommation d'eau

Quantité quotidienne (m3)	Méthodes de récupération de l'eau proposées	Emplacement de récupération de l'eau proposé
0	We use water only for drinking and eating.	Surface snow.

Déchets

Gestion des déchets

Activités du projet	Type des déchets	Quantité prévue	Méthode d'élimination	Procédures de traitement supplémentaires
Access Road	Other, Non-Combustible wastes	200 Units of freeze-dried food pouch (cleaned)	After each meal, we will directly store each packaging into a sealed container that we will sealed during the whole expedition. We will then hand the container to the appropriate authorities upon arrival in Pangnirtung.	None additional treatment procedures
Access Road	Eaux usées (matières de vidange)	50kg	Each evening, we will use a Wag Bag with disinfectant gel, placed in a bucket inside the tent. After use, the Wag Bag will be sealed and stored in an airtight container to prevent any contamination, which will remain closed for the entire expedition. Upon arrival in Pangnirtung, we will hand the container over to the appropriate authorities for proper disposal.	None additional Treatment Procedures

Répercussions environnementales :

The project is expected to result in minimal environmental impacts due to its temporary, small-scale nature and its implementation during the winter period over frozen and snow-covered ground. Potential disturbances to soil, vegetation, and wildlife are anticipated to be negligible and short-term. Mitigation measures include the use of a temporary travel corridor, avoidance of sensitive areas if identified, and continuous visual monitoring of wildlife to prevent disturbance. From a socio-economic perspective, minor positive effects may occur through local expenditures and services associated with the project, which may contribute modestly to community well-being. No significant adverse effects on human health, traditional land use, or community activities are anticipated.

Description de l'environnement existant : Environnement physique

The proposed route crosses the interior of Baffin Island, between the communities of Clyde River and Pangnirtung. The corridor does not pass through any official protected areas or designated parks; it primarily traverses lands owned by the Inuit. The area is characterized by an Arctic environment featuring mountainous terrain, continuous permafrost, soils and sediments typical of northern regions, and multiple watersheds feeding rivers and lakes. The zone may also include natural habitats used by terrestrial and marine wildlife, as well as migration routes. Environmental conditions include a cold Arctic climate, generally high air quality, and low levels of anthropogenic noise. Physical characteristics to consider include topography, soil stability, local hydrology, water quality and quantity, as well as future climate trends that may influence permafrost stability and natural landscape processes.

Description de l'environnement existant : Environnement biologique

The proposed corridor crosses a sparsely inhabited area of the interior of Baffin Island, between Clyde River and Pangnirtung. Terrestrial vegetation is typical of the Arctic tundra and remains limited during the polar winter. Wildlife in the area may include terrestrial and marine species adapted to Arctic conditions, some of which use the area for seasonal movements. Migratory birds and their habitats may also be present in the region at other times of the year, although their presence is very limited during winter. Species of concern or protected under federal or territorial regulations, including under the Species at Risk Act, may also use the area depending on the season. Freshwater aquatic habitats along the corridor may support certain fish species and other aquatic organisms. However, as the work will take place during the polar winter, biological activity, visible vegetation, and the movements of many species are expected to be reduced during the period of intervention.

Description de l'environnement existant : Environnement socio-économique

The proposed corridor crosses a sparsely inhabited area of the interior of Baffin Island, between Clyde River and Pangnirtung, where socio-economic activities are primarily related to traditional Inuit practices such as hunting, fishing, and travel across the land. Human traffic in the area is generally low and limited to seasonal local movements, mainly by snowmobile in winter. In this isolated context, socio-economic and human health components are primarily associated with the continuation of traditional activities, access to the land, and the overall well-being of local communities. Other valued socio-economic components may be identified as needed through community consultations and review of available literature.

Miscellaneous Project Information

Identification des répercussions et mesures d'atténuation proposées

The planned activities under the project are expected to result in little to no significant environmental or socio-economic impacts, given their temporary nature, execution during winter, and location in a remote area away from communities. Identified impacts are generally considered negligible or mitigable, and no unmitigable negative impacts are anticipated. As activities will take place along a temporary corridor without permanent infrastructure, potential disturbances to soil, snow, and the natural environment are expected to be limited and short-lived. From a socio-economic and human health perspective, no impacts are expected. The project takes place in the interior of Baffin Island, between Clyde River and Pangnirtung, away from inhabited areas. Activities are not expected to significantly interfere with traditional land uses, such as hunting or seasonal travel. No direct negative effects on the physical, social, psychological, or cultural well-being of communities are anticipated. Given the local and temporary nature of the project, no transboundary effects are expected. Regarding protected species, no direct interaction with species listed under the Species at Risk Act, their critical habitats, or residences is anticipated. Activities will occur during the polar winter, a period when biological activity is generally reduced in the region. Nevertheless, precautionary measures will be implemented to avoid disturbance to wildlife if any is observed near operations. Planned mitigation measures include scheduling activities during winter, using temporary travel corridors over frozen and snow-covered ground, and avoiding sensitive areas if identified on-site. Visual monitoring of wildlife and environmental conditions will be maintained during activities to ensure that any unforeseen interactions are managed promptly and that impacts remain minimal and temporary.

Répercussions cumulatives

Given the temporary and small-scale nature of the project in the interior of Baffin Island, between Clyde River and Pangnirtung, no significant cumulative impact with past, present, or reasonably foreseeable activities in the area is anticipated.
