

Demande de la CNER faisant l'objet d'un examen préalable #125474
Nirjutiqarvik National Wildlife Area Clean-up

DÉTAILS

Description non technique de la proposition de projet

Anglais: The North Water Research Station was established on Coburg Island of the Nirjutiqarvik National Wildlife Area in the 1960's. The research station was operated by a group that included McGill University, the University of Calgary Arctic Institute, the Department of Fisheries and Oceans and Energy Mines and Resources of the Government of Canada. Operations ceased in the 1980s. Over the years, numerous fuel drums, propane tanks and other materials have been left behind and the research station has fallen into a state of disrepair. In the early 2000's, a remediation project was conducted to clean-up any remaining contaminants and to compact and remove debris. Unfortunately the project was not completed. While the site is now clear of contamination, there are 150+ empty fuel drums, several 100 lb propane tanks, and other debris remaining. With the support of the Polar Continental Shelf Project, the Canadian Wildlife Service and the Nirjutiqarvik Area Co-Management Committee will conduct a clean-up of the site. A team of six members will travel to the site where they will set-up a small temporary tent camp. Over a period of up to two weeks, the crew will dig out any fuel drums that have been partially buried by sand or frozen in ice, and haul the drums and other debris across a small ravine over to the landing strip. The drums and debris will be hauled out by twin otter and taken to Resolute Bay. Because a number of the fuel drums have been crushed and all drums are empty, we anticipate that approximately 14 round trip twin otter flights to/from the site from Resolute Bay will be required. All fuel drums and other debris will be packaged up in Resolute and shipped out via sealift. Local members from Grise Fiord and possibly Resolute Bay will be hired to participate in the project. The research station will be dismantled and if suitable all non-toxic components will be burned. If burning is not an option, it will be shipped out with the other debris. It is our hope to complete the clean-up in time for a late fall/early winter open house in the community of Grise Fiord to showcase the site and the committee's management plans for the National Wildlife Area. An ATV and a zodiac will be used to travel around the island to get to various sites.

Français: La station de recherche des eaux du Nord a été créée dans les années 1960 sur l'île Coburg de la réserve nationale de faune du Nirjutiqarvik. La station de recherche était exploitée par un groupe comprenant l'Université McGill, l'Arctic Institute de l'Université de Calgary, le ministère des Pêches et des Océans et le ministère de l'Énergie, Mines et Ressources du gouvernement du Canada. Les opérations ont cessé dans les années 1980. Au fil des ans, de nombreux fûts de carburant, réservoirs de propane et autres matériaux ont été oubliés et la station de recherche est en très mauvais état. Au début des années 2000, un projet d'assainissement a été mené pour nettoyer tous les contaminants restants et pour compacter et éliminer les débris. Malheureusement, le projet n'a pas été achevé. Bien que le site ne soit plus contaminé, il reste plus de 150 fûts de carburant vides, plusieurs réservoirs de propane de 100 lb et d'autres débris. Avec le soutien du Projet du plateau continental polaire, le Service canadien de la faune et le Comité de cogestion de la région de Nirjutiqarvik procéderont à un nettoyage du site. Une équipe de six membres se rendra sur le site où ils installeront un petit camp de tentes temporaire. Au cours d'une période pouvant aller jusqu'à deux semaines, l'équipage extraira tous les fûts de carburant partiellement enfouis sous le sable ou dans la glace, et les transportera à travers un petit ravin jusqu'à la piste. Les tambours et les débris seront sortis par une loutre jumelle et transportés à Resolute Bay. Étant donné qu'un certain nombre de fûts de carburant ont été écrasés et que tous les fûts sont vides, nous prévoyons qu'il faudra environ 14 vols aller-retour à bord de loutres jumelles à partir du site à partir de Resolute Bay. Tous les fûts de carburant et autres débris seront emballés dans Resolute et expédiés par transport maritime. Des membres locaux de Grise Fiord et éventuellement de Resolute Bay seront embauchés pour participer au projet. La station de recherche sera démantelée et, le cas échéant, tous les composants non toxiques seront brûlés. Si la gravure n'est pas une option, elle sera expédiée avec les autres débris. Nous espérons terminer les travaux de nettoyage à temps pour la tenue d'une journée portes ouvertes à la fin de l'automne et au début de l'hiver dans la communauté de Grise Fiord afin de présenter le site et les plans de gestion du comité pour la réserve nationale de faune. Un VTT et un zodiac seront utilisés pour parcourir l'île pour se rendre sur divers sites.

[illegible]

Operations Phase: from 2019-07-26 to 2019-08-31

Activités

Emplacement	Type d'activité	Statut des terres	Historique du site	Site à valeur archéologique ou paléontologique	Proximité des collectivités les plus proches et de toute zone protégée
Nirjutiqarvik National Wildlife Area - Eastern shore	Site Cleanup/Remediation	Crown	In the 1960s the North Water Research Station was established. Operations ceased in the 1980s. A clean-up was conducted in the early 2000s but did not get completed.	There are a few old tent rings down the end of the beach. The clean-up is well away from these.	120 km SE of Grise Fiord. Located within a National Wildlife Area

Engagement de la collectivité et avantages pour la région

Collectivité	Nom	Organisme	Date de la prise de contact
Grise Fiord	Marty Kuluguqtuq	Nirjutiqarvik Area Co-Management Committee	2019-06-04

Autorisations

Indiquez les zones dans lesquelles le projet est situé:

North Baffin

Autorisations

Organisme de régulation	Description des autorisations	État actuel	Date de l'émission/de la demande	Date d'échéance
Service canadien de la faune	National Wildlife Area access permit.	Applied, Decision Pending		

Project transportation types

Transportation Type	Utilisation proposée	Length of Use
Air	Twin Otter	
Water	Zodiac with 30 hp motor	
Land	ATVs - 440 cc	

Project accomodation types

Temporary Camp

Utilisation de matériel

Équipement à utiliser (y compris les perceuses, les pompes, les aéronefs, les véhicules, etc.)

Type d'équipement	Quantité	Taille – Dimensions	Utilisation proposée
zodiac	1	14 foot	transport
Yahama outboard 4 stroke	1	30 hp	For zodiac
ATV	2	450 cc	travel around the area and haul debris
Twin Otter	1	15 m	Transport to/from the island, haul debris out

Décrivez l'utilisation du carburant et des marchandises dangereuses

Décrivez l'utilisation de carburant :	Type de carburant	Nombre de conteneurs	Capacité du conteneur	Quantité totale	Unités	Utilisation proposée
Propane	fuel	2	20	40	Lbs	heating, cooking
Gasoline	fuel	4	20	80	Liters	for zodiac and atvs
	fuel	1	4	4	Liters	naptha for cooking

Consommation d'eau

Quantité quotidienne (m3)	Méthodes de récupération de l'eau proposées	Emplacement de récupération de l'eau proposé
0	use of water buckets	near by ponds, rivers

Déchets

Gestion des déchets

Activités du projet	Type des déchets	Quantité prévue	Méthode d'élimination	Procédures de traitement supplémentaires
Site Cleanup/Remediation	Eaux grises	280 litres	Pour into a pit and bury prior to departure.	lime
Site Cleanup/Remediation	Eaux usées (matières de vidange)	672 litres	cat holes, covered with dirt	lime

Répercussions environnementales :

Any impact resulting from this project will be minimal and temporary. At the most there may be temporary disturbance of the wildlife traveling through the area. The overall result of this project will be to reverse the environmental impacts of years of research leaving behind their fuel drums and other trash. The camp will be a leave no trace camp and as a result of the clean-up we will leave the area looking better than it did before we got there.

Description de l'environnement existant : Environnement physique

Coburg Island, where the clean-up is intended to occur is located within the Nirjutiqarvik National Wildlife Area. Immediately adjacent to the island is the Prince Charlotte Monument, a small island just off the south-eastern tip. The National Wildlife Area also hosts a portion of the North Water Polynya.

Description de l'environnement existant : Environnement biologique

The island is the site of significant seabird colonies (Thick-billed Murre, Black-legged Kittiwake and Northern Fulmar. Princess Charlottes Monument, hosts the northernmost breeding colony of the Atlantic Puffin. Polar bears are common in the area and a variety of marine species frequent the waters around the island. The area in which the clean-up will be conducted is on a raised beach off the eastern shoreline of the island. The area is gravelly with limited vegetation. The raised beach drops down onto a lower beach that is eroding from the waves. There is a small network of ponds to the west of the beach and a small creek that drains into the ocean between the research station and the airstrip.

Description de l'environnement existant : Environnement socio-économique

The site is 120 km southeast of Grise Fiord, it's nearest community. Residents rarely go there given the distance, but have traveled there for hunting and also to collect Thick-billed Murre eggs from the colony. There have been some presumably ancient tent rings observed in the area. It is believed that Greenland Inuit have traveled to the site regularly in the past. Currently it is largely visited by tourists on cruise ships. The island is immediately adjacent to the North Water Polynya, an area of significant area of cultural and ecological importance for Inuit of Canada and of Greenland. At certain points throughout the year, the polynya extends into the marine boundary of the NWA.

Miscellaneous Project Information

Identification des répercussions et mesures d'atténuation proposées

There will be temporary disturbance at the site with the occurrence of up to 15 flights into the site to transport people and remove debris (fuel drums, propane cylinders, and other garbage). Pilots will be instructed to follow the seabird colony setback guidelines that ECCC submitted to the Nunavut Planning Commission for land use planning. Overall impacts will be minimal given the location of the clean-up and the benefits of the clean-up will by far outweigh any impacts from the temporary disturbance.

Répercussions cumulatives

I do not anticipate that there will be any cumulative effects. The only impact will be the reclamation of a site that is long overdue after years of researchers left their debris behind. The impact will only be beneficial to the land and wildlife.

Impacts

Identification des répercussions environnementales

	PHYSICAL	Designated environmental areas	Ground stability	Permafrost	Hydrology / Limnology	Water quality	Climate conditions	Eskers and other unique or fragile landscapes	Surface and bedrock geology	Sediment and soil quality	Tidal processes and bathymetry	Air quality	Noise levels	BIOLOGICAL	Vegetation	Wildlife, including habitat and migration patterns	Birds, including habitat and migration patterns	Aquatic species, incl. habitat and migration/spawning	Wildlife protected areas	SOCIO-ECONOMIC	Archaeological and cultural historic sites	Employment	Community wellness	Community infrastructure	Human health
