Quarry Site	Quarry/Borrow pit	Commissioners	A portion of the area that will become the quarry is used by carvers to extract stone. The quarry is also adjacent to the road and trails that lead to Victor Bay, which is an important harvesting area. Measures are included in the construction environmental management plan (CEMP) to confirm that rocks are available for carvers, and to confirm that harvesting access is not restricted during construction.	An AIA was conducted in 2019 by Lifeways of Canada in support of the Project in Arctic Bay. No archaeological features were reported within the Quarry Study Area. However, if required an additional survey will be undertaken prior to construction as directed by the Government of Nunavut - Culture and Heritage department.	the quarry is located 1.5 km northwest of the community. There are no terrestrial protected areas in proximity to the quarry. see Figure 1-1 of Project documents for quarry location.
Arctic Bay Harbour	Offshore Infrastructure (port, break water, dock)	Crown	The current harbour has one small breakwater providing a semi-sheltered area for small craft moorage. The rubble mounded breakwater configuration exposes the harbour to waves from the south and south-west resulting in unsafe conditions. See Section 1.3 and Photo 1-1 of the PSIR supplementary report for details.	An Archaeological Impact Assessment (AIA) was conducted in 2019 by Lifeways of Canada in support of the Project in Arctic Bay. No archaeological features were reported within the SCH Study Area (excluded subtidal portions). If required, an additional survey will be undertaken prior to construction as directed by the GN-C&H.	The SCH is within the community of Arctic Bay waterfront. The SCH will incorporate the existing breakwater into design. See Figure 1-1 (SCH location), Figure 1-2 (SCH layout) of Project documents for more information. The closest communities to Arctic Bay are Pond Inlet and Resolute, which are 240 km E and 350 km NW respectively. See Section 1.18 and Figure 1-4 of the PSIR supplementary report for details

Environment and Climate Change Canada	Disposal at Sea (DAS) is not considered likely, however if required a DAS application will be submitted to Environment and Climate Change Canada (ECCC). A sample analysis plan (SAP) was submitted to and approved by ECCC for sediment analysis in the dredge footprint of the SCH. ECCC has been engaged from an early stage in project planning as the proponent (DFO-SCH) is a federal agency	Not Yet Applied		
Tingmiliqiyiitkut Kaanatami	A Notice of Works (NoW) is expected to be required from Transport Canada due to the potential for interferences to navigation during construction, and to confirm navigational markers required during operations of the SCH. TC has been engaged from an early stage in project planning as the proponent (DFO-SCH) is a federal agency. Maintaining access for harvesters to the marine environment during construction has been a key part of consultation and measures will be in place during construction to confirm there are no access restrictions for hunters.	Not Yet Applied		

Anguhikiyiit Kanatami	a permit from NRCan is expected to be required for the transportation and storage of explosives (required for blasting). NRCan compliance requirements will be the responsibility of the contractor and will be applied for after contract award and before the start of construction	Not Yet Applied		
Nunavut Imaligiyyit Katimayit	A Type B license may be required if the haul road upgrades requires culverts to be installed or if stream alteration is required for the Project. As the streams are not major water courses, it is expected that a Type B permit will be acceptable. NWB compliance requirements will be the responsibility of the contractor and will be applied for after contract award and before the start of construction	Not Yet Applied		
Iqalukhiurniqmut Tariuqmilu Kaanata	A Fisheries Act Authorization (FAA) will be required due to the permanent loss of seabed habitat due to the construction of the Small Craft Harbour. DFO-Fish and Fish Habitat Protection Program (FFHPP) has been engaged from an early stage in project planning as the proponent (DFO-SCH) is a federal agency	Applied, Decision Pending		

Project transportation types

Transportation Type	Qanuq Atuqtauniarmangaa	Length of Use
Air	During construction, the Project will use commercially scheduled flights, with the potential for use of chartered flights but may need to use chartered flights if the existing service cannot support the additional throughput. In addition, the Project will confirm that if commercial flights are used, that there is no effect to availability of flight service to locals	

Water	During construction, the Project will use the existing scheduled sealift deliveries

Avatiliriniqmut Ayurhautingit:

Potential impacts have been considered relative to the proposed construction activities (described in Section 2 of the PSIR supplementary report) for the Project Study Areas (Figure 1-1, described in Section 6.6 of the PSIR supplementary report) and specific to each of the VECs and SVECs. all impacts are considered as positive or negative/mitigatable. see Section 7 of the PSIR supplementary report for further information. Mitigation and monitoring measures will be in place to minimize negative impacts (see Section 5 of the CEMP).

Additional Information

SECTION A1: Project Info

Field investigations: Several field studies have been undertaken since 2019 and received an NPC conformity determination (No. 149425), NIRB SDR (No. 19YNO31), and NIR research permit (No 02 01121-R-M). A report was submitted to NRI in English and North Baffin Inuktitut for 2019 to 2020 programs (can be provided upon request). A 2021 drilling program occurred in March 2021. NPC issued a conformity determination to confirm the field program did not require additional review from NIRB. Additional field permits were obtained from NWB (8BD-ABH2122), CIRNAC (N2021S0003) and the GN-DoE (No. LUP-2021-001). The field studies so far have supported assessment of existing conditions and the determination of potential quarry and disposal at sea sites. A drilling program was undertaken in March 2021 to inform geotechnical requirements for detailed design. Project: Supporting components for the construction of the SCH, include a quarry and a haul road. These components are summarized in the Project description and are further described in the PSIR supplementary report.

SECTION A2: Allweather Road

An existing road is planned to be used to support the transportation of rock materials from the quarry to the SCH. Upgrades to the road will occur prior to construction and will be described in the PSIR document. In required, the contractor will be responsible for necessary permits from the NWB. Measures to manage traffic interactions with the community will be described in the CEMP, and the contractor will be required to develop a Traffic Management Plan (TMP) to detail methodologies (e.g. use of dust suppressants, speed limits, training requirements) to be undertaken to support CEMP requirements.

SECTION A3: Winter Road

SECTION B1: Project Info

SECTION B2: Exploration Activity

SECTION B3: Geosciences

SECTION B4: Drilling

SECTION B5: Stripping

SECTION B6: Underground Activity

SECTION B7: Waste Rock

SECTION B8: Stockpiles

SECTION B9: Mine Development

SECTION B10: Geology

SECTION B11: Mine

SECTION B12: Mill

SECTION C1: Pits

a quarry will be required to support construction of the SCH (see preferred quarry location in Figure 1-1). Activities

expected to occur at the quarry include drilling, blasting, stockpiling, crushing and screening. A summary of construction activities is provided in Section 2 of the PSIR supplementary report.

SECTION D1: Facility

See Project information section of this online application and Section 2.1 of the PSIR supplementary report

SECTION D2: Facility Construction

construction activities expected to be required at the SCH includes; infill, dredging, disposal at sea (unlikely) pile driving, and installation of small craft floats. A summary of construction activities is provided in Section 2 of the PSIR supplementary report

SECTION D3: Facility Operation

the SCH once operational will remain the responsibility of DFO-SCH. An Operations Environmental Management Plan (OEMP) will be prepared prior to operations of the SCH. There are not expected to be any differences in vessel use before and after the construction of the SCH. If any potential fisheries are successful, these are not a part of the current Project, and will be submitted to the Nunavut Planning Commission (NPC) for referral to NIRB under a separate application.

SECTION D4: Vessel Use

SECTION E1: Offshore Survey

SECTION E2: Nearshore Survey

SECTION E3: Vessel Use

SECTION F1: Site Cleanup

SECTION G1: Well Authorization

SECTION G2: Onland Exploration

SECTION G3: Offshore Exploration

SECTION G4: Rig

SECTION H1: Vessel Use

there is no shipping associated with the project construction as all materials will arrive under existing scheduled sealift deliveries.

SECTION H2: Disposal At Sea

it has not been determined if disposal at sea is required, however the preferred DAS site is shown in Figure 1-1.

SECTION I1: Municipal Development

Qanurittuq Ittunik Avatinga: Avatingalluanga

the physical environment is described in Sections 3 to 7 of the ESEB report (Environmental and Socio-Economic

Baseline Report) and summarized in Section 6.4 of the PSIR supplementary report. Both documents have been uploaded to the NIRB portal.

Qanurittuq Ittunik Avatinga: Inuuhimayunut Avatinga

the biological environment is described in Sections 8 to 12 of the ESEB report and summarized in Section 6.5 of the PSIR supplementary report

Qanurittuq Ittunik Avatinga: Inungit-maniliurutingit Avatinga

the socio-economic environment, including archaeological conditions are described in Sections 13 and 14 of the ESEB report and summarized in Section 6.5 of the PSIR supplementary report.

Miscellaneous Project Information

no miscellaneous information to add at this time

Naunaiyainiq ukuninnga Ayurhautingit unalu Piumayaat Ikikliyuumiutinahuarutit

Identification of potential and impacts and proposed mitigations will be summarized in Section 6 of the PSIR document. A construction environmental management plan (CEMP) is being developed which will provide details of mitigation and monitoring measures required to minimize or eliminate potential effects. Potential effects will be considered relative to the proposed construction activities for each of the Valued Ecosystem Components (VECs) and Valued Socio-Economic Components (VSECs) identified. Mitigation and monitoring measures being developed are being informed by best management practices, community consultation and regulatory conditions.

Tamatkiumayunik Ihuikgutivaktunik

there are not expected to be cumulative effects due to the Project. see Section 7.4 of the PSIR supplementary report for further discussion.
