# QANURITTUT

## Tukihiannaqtunik havaariya uyumayumik uqauhiuyun

Qablunaatitut: Who? I am a French PhD student at the MARINE Biodiversity Exploitation and Conservation (MARBEC) laboratory, in the Université de Montpellier. We are working in collaboration with Louis Bernatchez at the Université Laval. We will also collaborate with two groups of explorers, “La Voie Arctique” and “Le Vagabond”, who will sail on the arctic seas this summer. Both boats were designed to reduce all pollution and greenhouse gas emissions. What? Our goal is to sample environmental DNA (eDNA) in the Arctic regions of Canada, with a protocol completely carried out offshore (2 different boats). One boat will host 3 persons, the other one will host 4 persons. No facilities will be constructed. The analysis of eDNA will be carried out in France, and results will be shared with local communities and published in an open access journal. Sampling eDNA only requires to filter surface seawater: indeed, it has no impact on wildlife, it doesn't affect the species behavior and provides better results than most conventional survey methods. Why? We hope to survey marine fish communities in coastal waters, in order to detect early species arrivals due to climate change. This region is one of the less surveyed on the globe, but also the region where climate change will have the strongest effects, and thus we expect strong changes in the fish communities. We believe it is of great importance to study the area to know which marine fish species are present in the local communities. Where? One of the boats will sail from Sachs Harbour (Inuvialuit), to Greenland, thus passing through Nunavut in its northernmost parts, and the second boat will sail in the Baffin Sea, from Grise Fiord to Saint Pierre & Miquelon. The Vagabond will pass near 6 local communities: Iqaluit, Pangnirtung, Qikiqtarjuaq, Clyde River, Pond Inlet, and Grise Fiord. When? The Vagabond boat will start from Grise Fiord in early September, while La Voie Arctique will start from Sachs Harbour in June, and get to Nunavut as soon as the weather and the winds allow.

Qui ? Je suis un étudiant en doctorat à au laboratoire MARBEC (MARINE Biodiversité Exploitation and Conservation) à l'Université de Montpellier, et je travaille en collaboration avec Louis Bernatchez à l'Université de Laval. Ce travail se fera aussi en collaboration avec deux groupes d'explorateurs, « La voie arctique » et « Le Vagabond », qui navigueront à la voile dans les eaux arctiques cet été. Les deux bateaux sont optimisés pour réduire toute pollution et émissions de carbone. Quoi ? Notre but est d'échantillonner de l'ADN environnemental (ADNe) dans la région arctique du Canada, avec un protocole mené à bien en totalité au large, sur 2 différents bateaux. Il y aura 3 personnes à bord de l'un des bateaux, et 4 personnes à bord du second. Aucune construction d'infrastructure n'aura lieu durant l'expédition. L'analyse de l'ADNe sera réalisée en France, et les résultats seront partagés avec les communautés locales, puis publiés dans un journal en accès libre. L'échantillonnage de l'ADNe requiert seulement une filtration de l'eau de mer en surface : ainsi, elle n'a aucun impact sur la biodiversité locale, et n'affecte pas le comportement des espèces. Aussi, elle fournit de meilleurs résultats que les méthodes conventionnellement utilisées. Pourquoi ? Nous aimerions inventorier les espèces de poissons marins des eaux côtières afin de pouvoir détecter de potentielles arrivées d'espèces à cause du changement climatique. En effet, l'Arctique est une région des moins bien connues sur le globe, mais c'est aussi la région dans laquelle le changement climatique aura les effets les plus forts. Ainsi, on peut s'attendre à de fortes variations des assemblages d'espèces dans cette région, et c'est pour cela que nous pensons qu'il est d'importance capitale d'étudier cette zone. Où ? L'un des bateaux partira de Sachs Harbour (Inuvialuit) et naviguera jusqu'au Groenland, et passera donc au Nord du Nunavut. Le second bateau naviguera sur la Mer de Baffin, de Grise Fiord jusqu'à Saint-Pierre et Miquelon. En passant par ce trajet, le bateau sera amené à passer proche de 6 communautés locales : Iqualuit, Pangnirtung, Qikiqtarjuaq, Clyde River, Pond Inlet et Grise Fiord. Quand ? Le Vagabond démarrera de Grise Fiord début Septembre, tandis que La Voie Arctique partira de Sachs Harbour début Juin, rejoignant ainsi les eaux du Nunavut aussi tôt que les vents et la météo le permettront.

[illegible]

## **Miscellaneous Project Information**

Description of both vessels : Vagabond is a boat owned by Éric Brossier, which hosted over 12 research programs supported by the French Polar Institute Paul-Emile Victor, but has also hosted sportive or cinematographic expeditions. It was the first vessel to succeed in the Northeast Passage without wintering. Since 1999, Eric Brossier and his family have undertaken collaborative expeditions to support research in the Arctic waters. In 2022, the boat will start from Grise Fiord, on Ellesmere Island, and will sail through Baffin Sea, towards Saint-Pierre et Miquelon. Vagabond is an expedition yacht designed for polar expeditions, able to sail in ice and to provide a moving base camp to scientists. It is 15.3 meters long and 4.2 meters wide. It can carry up to 10 people onboard. More information and photos at: <https://vagabond.fr/eric/>-----

Sébastien Roubinet is a passionate skipper who has been sailing for more than 30 years on many seas, frozen or not, aboard many boats.

Sébastien and his crewmates have already sailed on the Arctic Seas many times. On his last adventures, his boat was used as a scientific platform, performing different protocols such as sampling water and ice, taking aerial photographs, all of this with a zero greenhouse gas emission policy. These areas are difficult to access for scientists and thus complicated to study, hence their strong implication to bring back the maximum amount of essential data to our studies, with eDNA sampling. This small sailing boat that resembles to a kayak will start from Sachs Harbour, in the Northwest Territories of Canada, and will sail towards the northern parts of Groenland, as long as the ice cap allows it. Babouch'Ty is a very small sailing boat, only 7 meters long and 2.4 meters wide. When emptied, it weighs only 200 kilograms, and has a capacity of 500 kilograms onboard. It uses solar panels to produce electricity, and can be hauled on ice if necessary. More information nad photos at: <https://www.sebroubinet.eu/>
