QANURITTUT

Tukihannaqtunik havaariyayumayumik uqauhiuyun

Qablunaatitut: Qulliq Energy Corporation (QEC) is a Government of Nunavut territorial corporation. Through the operation of 25 stand-alone diesel power plants, QEC is the sole provider of electricity to approximately 15,000 customers in the territory. Qulliq Energy Corporation is proposing to construct and operate a new power plant in the Hamlet of Chesterfield Inlet. This will replace the existing power plant, which was constructed in 1975 and which has exceeded its design life. As the facility continues to age and become more outdated, it has become more difficult to maintain, and thus reliability is declining. Without reliable equipment, QEC's customers are at risk of system failure. This proposed multi-year project will include a new four-engine power generation facility with installed capacity of 1,270 kilowatts. It is designed for a lifespan exceeding 40 years, and it will incorporate new technology to improve reliability, efficiency, and safety. Construction will include a fuel-storage system consisting of two 90,000 litre horizontal fuel tanks, and fuel-pumping facilities. QEC also plans to construct a Quonset garage, as well as storage facilities for transformers, utility poles, oil, and glycol. Space will be allocated for transient staff accommodations, sea cans for storage, and a back-up emergency generator. Upgrades to the existing distribution system will also be required to connect to the new power plant. An approximately 250-metre fuel pipeline will be constructed to connect to the Petroleum Products Division (PPD) bulk fuel facility located to the southwest. The pipeline will be a combination of aboveground and underground construction. The new plant will be capable of integrating renewable energy sources. The proposed new lot is approximately 6,200 square metres located on unsurveyed, untitled municipal land off of Crescent 1A, and is located 250 metres northeast of the PPD bulk fuel facility. The area proposed for the power plant has been designated by the Hamlet for industrial land use. A QEC land application was approved by the Hamlet of Chesterfield Inlet on September 3, 2020. The Nunavut Water Board has confirmed that our plant will not affect any water bodies. There are no designated wildlife areas, marine protected areas, territorial or national parks or Inuit-owned lands in conflict with the power plant location. An archaeological impact assessment was carried out in July 2021, and 30-metre buffer zones were established. Construction fencing will be used to ensure that heavy machinery does not enter the buffer zone. The anticipated project schedule is shown below.

Schedule for the Chesterfield Inlet Power Plant Project	Task	Time
Studies	Choosing the site and doing the	March 2021 to March 2022 (already done)
Detailed Engineering Design	April 2023 to March 2024	
We hire a Contractor	April 2024 to March 2025	
Contractor builds the new plant	April 2025 to December 2026 (seasonal)	
Testing the new plant	January 2027 to March 2027	
Plant Handover to QEC Staff	March/April 2027	
Operations (power production)	2027 to 2067 and beyond	
On average, 21 workers are estimated to be required on-site for the duration of construction.	2027 to 2067 and beyond	
This will vary based on the construction phase. The contractor awarded the construction tender will determine the required labour force to meet project requirements.	2027 to 2067 and beyond	
Contractors will be obligated to meet mandatory Inuit labour levels for all construction work.	2027 to 2067 and beyond	
QEC has staff in Chesterfield Inlet who take care of the daily operation of the existing power plant.	2027 to 2067 and beyond	
This includes a full-time Plant Superintendent and two part-time Assistant Operators.	2027 to 2067 and beyond	
Existing staff will transition over to the new power plant once it has been constructed and commissioned.	2027 to 2067 and beyond	
No new staffing is anticipated to be required as a result of this project.	2027 to 2067 and beyond	
The majority of construction materials for the project will be delivered by annual sealift.	2027 to 2067 and beyond	
Some materials may be sourced locally or delivered via cargo plane depending on size and quantity.	2027 to 2067 and beyond	
The contractor will be responsible for sourcing construction equipment.	2027 to 2067 and beyond	
This may include subcontracting locally available equipment or bringing equipment to the community through the annual sealift.	2027 to 2067 and beyond	
This project is anticipated to provide an overall benefit to the Hamlet of Chesterfield Inlet with more efficient use of diesel fuel and the reduction of greenhouse-gas emissions.	2027 to 2067 and beyond	
It will also enable QEC to improve power generation infrastructure in the community, support future growth, and achieve its mandate for the provision of safe, reliable electrical power to the communities that it serves.	2027 to 2067 and beyond	
(Note: This power plant will run for more than 40 years. However, the software that runs this NIRB website is unable to accept dates past calendar year 2049. The actual plant lifetime will extend beyond the year 2067.)	2027 to 2067 and beyond	

Uiviititut: La Société d'énergie Qulliq (« la Société ») est une entreprise territoriale publique du gouvernement du Nunavut. Celle-ci opère 25 centrales électriques autonomes, ce qui fait d'elle l'unique fournisseur d'électricité pour quelque 15 000 clients dans le territoire. La Société soumet un projet pour la construction et l'exploitation d'une nouvelle centrale électrique dans le hameau de Chesterfield Inlet. Celle-ci viendrait remplacer l'actuelle centrale, qui est en service depuis sa construction en 1975, et dont la durée de vie est dépassée. En effet, la centrale actuelle est désuète et continue à prendre de l'âge, ce qui complique son entretien et diminue sa fiabilité. L'absence d'équipement fiable expose la clientèle de la Société à un risque de défaillance du système. Ce projet plurianuel comporte une nouvelle installation à quadrimoteur pour la production d'énergie électrique puissance installée de 1 270 kilowatts. Il est conçu pour dépasser 40 années de vie, et incorpore de nouvelles technologies qui améliorent la fiabilité, l'efficacité et la sécurité. Il prévoit également la construction d'un système de stockage de carburant qui consiste en deux réservoirs horizontaux de 90 000 litres, et en installations de pompage. En outre, le projet comporte un garage préfabriqué en tôle ondulée et des espaces

d'entreposage pour transformateurs, poteaux électriques, mazout et glycol. Un espace sera réservé pour l'hébergement du personnel de passage et l'entreposage de conteneurs maritimes et d'une génératrice de secours supplémentaire. Par ailleurs, le système actuel de distribution devra être mis à niveau avant d'être branché à la nouvelle centrale électrique. Le chantier comporte l'ajout d'un oléoduc d'environ 250 mètres reliant celle-ci à l'installation de combustible en vrac de la Division des produits pétroliers située dans le secteur sud-ouest. L'oléoduc sera en partie à ciel ouvert et en partie souterrain. Il sera possible d'intégrer des sources d'énergies renouvelables à la nouvelle centrale. Le site proposé pour ce projet couvre environ 6 200 mètres carrés et est situé sur un terrain municipal non arpenté et sans titre de propriété en retrait du Croissant 1A, à 250 mètres au nord-est de l'installation de combustible en vrac de la Division des produits pétroliers. Ce terrain a été désigné site à utilisation industrielle par le hameau. Une demande de terre faite par la Société d'énergie Qulliq a été approuvée par le hameau de Chesterfield Inlet le 3 septembre 2020. L'Office des eaux du Nunavut atteste que cette centrale n'aura de répercussion sur aucun plan d'eau. De plus, son emplacement ne menace aucune aire désignée comme réserve d'espèces sauvages, aire marine protégée, terre d'appartenance inuite, ou parc territorial ou national quels qu'ils soient. En juillet 2021, une évaluation des incidences de ce projet sur le plan archéologique a été menée, et une zone tampon de 30 mètres a été établie. Le chantier sera clôturé pour éviter le passage de la machinerie lourde dans cette zone. Le calendrier de projet proposé figure ci-dessous.

Calendrier du projet de centrale électrique de Chesterfield Inlet

Tâche	Début	Fin
Étude détaillée	D'avril 2023	à mars 2024
Construction de la nouvelle centrale électrique	D'avril 2024	à mars 2025
Mise à l'épreuve de la nouvelle centrale	D'avril 2025	à décembre 2026 (activité saisonnière)
Mise en service (production d'énergie électrique)	De 2027 à 2067 et au-delà	En moyenne, le nombre d'effectifs requis sur les lieux pendant le chantier est estimé à 21 personnes. Ce nombre variera en fonction de la phase de construction. L'entrepreneur qui se verra accorder ce contrat établira le nombre d'effectifs requis en fonction des exigences du projet. Il lui incombera de répondre aux exigences en matière de main-d'œuvre inuite pour toutes les phases de la construction. La Société a du personnel à Chesterfield Inlet qui veille à l'exploitation quotidienne de la centrale existante. Cette équipe comporte une personne responsable à temps plein et deux autres postes à temps partiel pour l'exploitation. Le personnel en place migrera vers la nouvelle centrale une fois celle-ci mise en service. On ne prévoit pas que ce projet nécessitera l'embauche d'autres effectifs. La majorité des matériaux de construction pour le projet sera expédiée par transport maritime annuel. Certains matériaux pourraient toutefois être fournis par des entreprises locales ou par voie aérienne, selon le volume et la quantité nécessaires. L'approvisionnement en équipement de construction incombera à l'entrepreneur. Celui-ci peut aller en sous-traitance pour l'équipement déjà disponible localement ou faire livrer de l'équipement par le transport maritime annuel. On prévoit que ce projet profitera à l'ensemble du hameau de Chesterfield Inlet en augmentant l'efficacité du carburant diésel et en réduisant l'émission de gaz à effet de serre. Il permettra également à la Société d'améliorer son infrastructure de production d'énergie électrique dans cette localité, d'être en mesure de répondre à une future croissance des besoins et de réaliser son mandat, à savoir assurer un approvisionnement sécuritaire et fiable en électricité aux localités qu'il sert.

0	Because this plant uses radiators for cooling, the only use of water is for domestic use of employees on site. Estimated at 0.1 cubic metres per day. No water license required.	Tanked municipal water supply, with tanked sewage (honey truck, standard in communities throughout Nunavut).

Iqqakuq

Ikkakunik Munakgiyauyunik

Havauhikhaq Hulilukaarut	Qanurittuq Iqqakut	Ihumagiyaayuq Qanuraaluktut Atuqtait	Qanuq Iqqakuurniarmangaa	Halummaqtirarnirutikan piyutin
Equipment installation	Anaagun (inuin anaaguin)	100 litres per day	Standard sewage tank on site, with regular pump-outs via honey wagon.	Standard municipal lagoon, as used for serving everyone else in Nunavut.

Avatiliriniqmut Ayurhautingit:

- Noise and dust during construction will be mitigated by contractor keeping equipment in good working condition, by using water spray to control dust, and by working during normal daytime hours only.
- Spill-capture equipment and double-walled fuel tanks will be in use, both during construction and operation.
- Tanked water will be used at the plant, and sewage will be tanked.
- Power plant will use the most modern engines for lowest emissions, and emissions controls will be included. This power plant will bring a net positive benefit to the community by ensuring less pollution than the old power plant that it replaces. Noise will also be greatly reduced, both because the engines are newer and because the plant is no longer downtown. Power supply will be more reliable as well.

Qanurittuq Ittunik Avatinga: Avatingalluanga

•The area proposed for the power plant has been designated by the Hamlet as industrial land use and was the location previously identified by the Hamlet for the power plant. This implies that the Hamlet is interested in or is willing to consider some form of development in this area. •Surrounding development in this area is industrial in nature (e.g., PPD bulk fuel facility). •Given that the proposed power plant will be on an existing road and in close proximity to the PPD bulk fuel facility, community members or wildlife using this area will already be accustomed to traffic activity in the area. •The location selected for the power plant is generally flat terrain and is geologically amenable to construction. •Regarding a small creek that is located about 50 metres from our site, we have received confirmation from the Nunavut Water Board that no special procedures are required, given that our plant does not entail any water-takings, nor in-stream works, nor any discharge of waste to these small water features. We note that our use of diesel generators uses radiators to air for cooling. Our domestic water usage the plant will entail a freshwater tank along with a sewage tank, both serviced via truck. Construction activities will also entail tanked water, with portable toilets for employees. The contractor will also be required to ensure that surface disturbance (e.g. disrupted soils) are not able to run off the site. For this purpose, standard silt fences are anticipated to be used. •There are no designated wildlife areas, marine protected areas, territorial or national parks or Inuit owned lands in conflict with the power plant location.

Qanurittuq Ittunik Avatinga: Inuuhimayunut Avatinga

•There are no designated wildlife areas, marine protected areas, territorial or national parks or Inuit owned lands in conflict with the power plant location. The land is designated industrial and does not constitute special-value habitat for birds or other wildlife. That being said, it is acknowledged that terrestrial and marine wildlife may be observed in the general surrounding area, especially by observers equipped with tripod-mounted spotting scopes, high-powered telephoto lenses, and high-resolution digital single-lens-reflex cameras, or with other sophisticated optical imaging devices.

Qanurittuq Ittunik Avatinga: Inungit-maniliurutingit Avatinga

•The proposed power plant will be located about 1 kilometre from the centre of the hamlet, and it will also be downwind of the hamlet. This alleviates concerns regarding noise and emissions. Also, the design of the plant incorporates the latest emissions-control technology (dry oxidation catalysts) with modern diesel technology that minimizes fuel consumption and minimizes emissions. The exhaust systems will include mufflers (also known as silencers) that are of “hospital-grade” for the greatest possible attenuation of sound throughout the frequency range typical of reciprocating internal combustion engines of the compression-ignition type. •An archaeological impact assessment was carried out in the summer of 2021 in order to determine if archaeological sites are in potential conflict with the project and identify any necessary avoidance or mitigation measures. Several graves were found near (but not on) the proposed power-plant site. We have planned the property boundaries of the proposed Chesterfield Inlet power plant in order to satisfy the 30-metre buffer zone requirement (i.e. 30 metres from the property boundary). To ensure that construction equipment remains well away from the grave sites, well-marked physical barriers will be erected and flagged, and the construction crew will be notified and all equipment operators will be briefed on these aspects. •In the event that latent cultural or archaeological artifacts are encountered during the construction at the site, construction activity will stop and the

Government of Nunavut Department of Culture and Heritage will be contacted. • During the construction work (estimated to take place over two summers), the contractors will be required to maintain equipment in good working order to reduce noise generation, and to avoid spills of fluids. • Construction will occur during typical working hours (e.g., 10 to 12-hour shift). • Dust suppression (e.g., water) will be used on-site during construction as required. • Other development in the surrounding area is industrial in nature. With this in mind, it is likely that community members nearby are already accustomed to some level of dust and noise emanating from this general area, due to the combination of the existing gravel roads and the general industrial and other activities that take place here. • Contractors will be required to have a spill response plan as well as spill response equipment and materials available in the event of a leak or spill. • In the event of a spill or leak, contaminated soil will be collected for disposal at an approved facility. • Contractors will be required to have a fuel management plan in place that includes refueling procedures and proper bulk storage if applicable.

Miscellaneous Project Information

• The old power plant will be decommissioned within one year of the commissioning of the new power plant at Chesterfield Inlet. Decommissioning of the old power plant is a separate project. • The new site at Chesterfield Inlet is an open lot and is readily viewable in Google Maps. • For emergencies pertaining to spills of fuels and other liquids, QEC has site-specific spill response plans for each of our 25 power plants. We will be preparing such a plan for the Chesterfield Inlet new power plant when construction of the new plant has been completed. • During the construction work, the construction firm will follow its own environmental management plan. This will include features such as double-walled fuel tanks for storing equipment for construction equipment, as well as having spill-clean-up equipment readily available. • All of QEC's power plants in this size range have dual-walled fuel tanks that have leak-detection monitoring via interstitial vacuums. Additional electronic leak-detection systems are present throughout the fuel system, thereby providing coverage of the tanks outside the building as well as the day tanks inside the building. These systems also interface electronically with the engines, which themselves keeping a running log of the fuel that they have consumed. Therefore, our operators are kept up-to-date on the remaining fuel levels in the tanks, as a function of fuel fillings and daily consumption. • Filling of the tanks can be done via tanker truck or by pipeline direct from the PPD tank farm. Various spill-containment and monitoring devices are present throughout the entire process. • Waste fluids are stored in drums that will be kept in sea-cans with their own built-in containment linings and berms. • The entire plant will be surrounded by a chain-link fence with a gate, to provide physical security. The plant itself will also have its own electronic security, in addition to a variety of security features including sensors and cameras with remote monitoring and automatic summoning of emergency response. • This comprehensive approach to security is to ensure reliable power and to defend against intrusions via physical and non-physical means. • Staff on site includes three employees on rotating shifts.

• During the construction phase, contractors will be required to have a spill response plan as well as spill response equipment and materials available in the event of a leak or spill. • In the event of a spill or leak, contaminated soil will be collected for disposal at an approved facility. • Contractors will be required to have a fuel management plan in place that includes refueling procedures and proper bulk storage if applicable. • During the operation phase, • In the event of a spill or leak, contaminated soil will be collected for disposal at an approved facility. • Contractors will be required to have a fuel management plan in place that includes refueling procedures and proper bulk storage if applicable.

Tamatkiumayunik Ihuikgutivaktunik

For all of the reasons described in the preceding sections, the cumulative effects of this power plant are expected to be smaller than those of the existing in-town power plant at Chesterfield Inlet.

Impacts
