QANURITTUT

Tukihiannaqtunik havaariyauyumayumik uqauhiuyun

Qablunaatitut: Northern Energy Capital (NEC) on behalf of Kivalliq Alternative Energy will conduct a preliminary renewable energy study for the community of Baker Lake, Nunavut. Baker Lake currently relies on four diesel generators to meet the local electricity demand. The intent of this study is to collect wind data to assess the feasibility of a utility-scale wind energy project in order to offset the reliance on diesel energy. The study will consider the use of wind turbines and a battery energy storage system. Wind energy does not pollute the air like diesel energy production. Diesel consumption releases particulate matter and fumes causing human health problems and environmental damage. Clean wind energy will promote human and environmental health in the community. NEC will install a device to measure wind speed, direction, and frequency over a 12-month period from Fall 2022 to Fall 2023. The wind monitoring equipment will be placed on the northern boundary of Baker Lake. The non-invasive equipment occupies a small footprint and is powered by a single propane tank. The equipment operates autonomously with regular servicing performed by local contractors hired by NEC. Thank you everyone for your support in this project.

Equipment installation	Ikulalimanngittun iqqakuuvaluin	0lbs	Landfill, recycled, reused, repurposed.	Proponent does not anticipate any waste during installation of SODAR equipment. The crating the equipment arrives in will be reused to move the equipment after the 12-month study. The emptied propane tanks after use will be stored at Peters Expediting Limited and refilled and reused. Should there be any waste, NEC will come prepared with a plan in place to dispose of the waste in an effective and appropriate matter that complies with local regulatory guidelines.

Avatiliriniqmut Ayurhautingit:

Waste, impact mitigation, and environmental impacts from SODAR feasibility projects are typically very low and limited to land use displacement and construction if necessary. Nevertheless, the project team has endeavoured to identify and prevent any unacceptable environmental impacts or impacts on traditional land use. Potential risks identified that could be caused by the project are listed below, and due to character limits, the planned mitigation strategies will be stored in the documents section. Risks include disturbance of land resulting in habitat destruction, impact to caribou migratory corridors and habitat range, leak or spillage of fuel resulting in ground contamination, interference with traditional land use, presence of archaeological sites or artifacts, and unforeseen generation of construction waste. A comprehensive outline for mitigation measures is attached in Project Documents.

Qanurittuq Ittunik Avatinga: Avatingalluanga

The ground surface is compromised mostly of jagged rock. We intent to place the 0.5m x 0.5m SODAR device on the most level surface within the permitted zone. The proponent consulted CGS Land Administration for site history and proximity to sensitive habitats, proponent reviewed caribou migration and rutting paths as part of a desktop study and devised a plan of action in case of emergency. This is outlined in the Predicted Environmental impacts document found in Project Documents.

Qanurittuq Ittunik Avatinga: Inuuhimayunut Avatinga

Please review Predicted environmental impacts of undertaking and proposed mitigation measures located in Project Documents.

Qanurittuq Ittunik Avatinga: Inungit-maniliurutingit Avatinga

The proposed site is in the outer boundary of the municipality. The equipment has a small footprint and isn't expected to disrupt activity in the area. NEC has contracted Peters Expediting Limited to perform routine check-ups on the equipment to check for interference. The equipment is also fitted with surveillance equipment to identify human and animal activity in proximity to equipment.
