QANURITTUT

Tukihiannaqtunik havaariya uyumayumik uqauhiuyun

Qablunaatitut: Permafrost Pathways is a multi-institutional project made of scientists, international policy experts, and community stakeholders, led by Dr. Susan Natali at the Woodwell Climate Research Center. Our goal is to quantify permafrost degradation across the Arctic boreal region, and use these results to guide more realistic international climate policy. Currently, estimates of carbon emissions from permafrost regions are highly variable and thus, policymakers do not account for these emissions when setting emissions reduction targets. We intend to measure carbon exchange where data is needed most across the Arctic boreal region using a network of monitoring stations, including in Nunavut. Over the course of five years, these stations will measure carbon dioxide and methane emissions from natural permafrost ecosystems. The monitoring stations would remain in Nunavut year-round and are constructed using a structure such as a metal tri-pod, with sensors attached above and below ground. These sensors collect data about weather and environmental conditions and associated greenhouse gas exchange. Storage of the data will be managed by our organization, but all data will be openly shared to a repository at the end of each calendar year. The availability of this data will promote collaboration with other researchers. We ultimately will publish our results that identify relationships between climate change and loss of permafrost. Our project will have a relatively small impact on the lives of Nunavut residents. Our researchers will install the monitoring station in an undisturbed location that will be approved by the land owner and local organizations, and we will return annually to repair and maintain the sensors. We also plan to contract a local resident to make small adjustments to the sensors and assist with troubleshooting throughout the year. We intend to and would like to participate in a town meeting annually to share our research and answer any questions local residents may have about our local research site and larger goals. This includes meetings in Resolute, Iqaluit, and/or any other location that we may work in the future.

Uiviititut: Permafrost Pathways est un projet multi-institutionnel composé de scientifiques, d'experts en politiques internationales et d'intervenants communautaires, dirigé par la Dre Susan Natali du Woodwell Climate Research Center. Notre objectif est de quantifier la dégradation du pergélisol dans la région boréale arctique et d'utiliser ces résultats pour orienter une politique climatique internationale plus réaliste. À l'heure actuelle, les estimations des émissions de carbone des régions de pergélisol sont très variables et, par conséquent, les décideurs ne tiennent pas compte de ces émissions lorsqu'ils fixent des objectifs de réduction des émissions. Nous avons l'intention de mesurer les échanges de carbone là où les données sont les plus nécessaires dans la région boréale de l'Arctique à l'aide d'un réseau de stations de surveillance, y compris au Nunavut. Sur une période de cinq ans, ces stations mesureront les émissions de dioxyde de carbone et de méthane des écosystèmes naturels du pergélisol. Les stations de surveillance demeureront au Nunavut toute l'année et sont construites à l'aide d'une structure telle qu'un tripod métallique, avec des capteurs fixés au-dessus et au-dessous du sol. Ces capteurs recueillent des données sur les conditions météorologiques et environnementales et les échanges de gaz à effet de serre associés. Le stockage des données sera géré par notre organisation, mais toutes les données seront partagées ouvertement dans un référentiel à la fin de chaque année civile. La disponibilité de ces données favorisera la collaboration avec d'autres chercheurs. Nous publierons en fin de compte nos résultats qui identifient les relations entre le changement climatique et la perte de pergélisol. Notre projet aura un impact relativement faible sur la vie des résidents du Nunavut. Nos chercheurs installeront la station de surveillance dans un endroit non perturbé qui sera approuvé par le propriétaire du terrain et les organisations locales, et nous reviendrons chaque année pour réparer et entretenir les capteurs. Nous prévoyons également de faire appel à un résident local pour apporter de petits ajustements aux capteurs et aider au dépannage tout au long de l'année. Nous avons l'intention et aimerions participer à une réunion de la ville chaque année pour partager nos recherches et répondre à toutes les questions que les résidents locaux pourraient avoir sur notre site de recherche local et nos objectifs plus larges. Cela comprend les réunions à Resolute, à Iqaluit et/ou à tout autre endroit où nous pourrions travailler à l'avenir.

Project transportation types

Transportation Type	Qanuq Atuqtauniarmangaa	Length of Use
Air	Commercial flights from YFB-YIO for all personnel	
Land	Truck or ATV access on public roads. We will take ATVs directly to the site (across tundra) only if allowed	

Project accomodation types

Nunauyuq

Ihuaqutivaluin Atuqtauyukhan

Hanalrutit atuqtaunahuat (ukuallu ikuutat, pampiutainnik, tingmitinik, akhaluutinik, hunaluuniit)

Hanalrutit Qanurittuq	Qaffiuyut	Aktikkulaanga – Qanurittullu	Qanuq Atuqtauniarmangaa
ATV	3	2m x 1.5m	We will use ATVs to tow our equipment to the monitoring site, as long as land owners approve.
Tripod towers	4	2m x 2m x 3m	These semi-permanent aluminum or galvanized steel tripods will be erected at the monitoring site (2 tripods at each site for a total of 4). We will use these to mount monitoring equipment for the duration of the project. We will remove them entirely at the end of the project
Scaffolding structure	2	1.5m x 3.2 m x 4.3m	These semi-permanent scaffolding structures will be erected at the monitoring site (1 at each site for a total of 2). We will install them above the tundra and anchor them to protect against wind. The structures will hold wind turbines and solar panels to power our equipment for the duration of the project. We will remove them entirely at the end of the project.

Waste includes cardboard boxes, plastic wrap, excess lengths of wire and tubing. No waste will remain at the site.	N/A

Avatiliriniqmut Ayurhautingit:

We anticipate that our project will not have any detrimental environmental impacts. During the installation phase, we will access the site to install research equipment, and this will involve carrying heavy batteries across the tundra from the road. We will do everything possible to keep the path short and use existing paths when present. Additionally, we will dig small holes to install sensors, but we will refill those holes and leave them otherwise undisturbed. During operation, the tower will be surrounded by wooden boardwalks to keep our feet above the delicate tundra. We will only visit the site as needed for maintenance, repairs, and cleaning. One pump will produce a small amount of noise during operation, but this noise will not be audible from more than 100m away.

Qanurittuq Ittunik Avatinga: Avatingalluanga

The existing environment where the study will be taking place is a natural tundra landscape in both Pond Inlet and Resolute Bay. These areas are represented by continuous permafrost with an active layer of < 1m. The soil is a granular till. Some trails already exist for community use.

Qanurittuq Ittunik Avatinga: Inuuhimayunut Avatinga

The existing biological environments in both Pond Inlet and Resolute Bay are a natural high Arctic tundra ecosystem with some minor human disturbance. The local watersheds consist of three primary vegetation communities; wet sedge, mesic tundra, and dry tundra. Minor disturbances within the watersheds include ATV and walking trails that have been formed through community access usage.

Qanurittuq Ittunik Avatinga: Inungit-maniliurutingit Avatinga

This research will be conducted within the municipal boundaries of both Pond Inlet and Resolute Bay. Local community members and youth will be hired and trained in research techniques, instrument maintenance, and data analysis.

Miscellaneous Project Information

We are attempting to involve the local community as closely as possible, by asking for their input in site locations as well as providing employment opportunities. We would also like to use our existing infrastructure to support other research that is important to the community.

Naunaiyainiq ukuninnga Ayurhautingit unalu Piumayaat Ikikliyuumiutinahuarutit

Our project will have minimal negative impacts on the physical, biological or socioeconomic environment. These consist only of physical access across natural tundra, and minimal noise from equipment. It will have however a positive impact on the employment opportunities in Pond Inlet and Resolute Bay. The project will also have a positive impact on the general advancement of knowledge of the area, which is beneficial for all of Nunavut.

Tamatkiumayunik Ihuikgutivaktunik

Continuous access to the sites over the timeframe of the project may have cumulative effects on the tundra, this will be mitigated by constructing a boardwalk to protect the vegetation and permafrost.
