## **Executive Summary**

This report presents the results of ambient air quality, dustfall, nitrogen dioxide and meteorological monitoring conducted by Agnico Eagle Mines Ltd. (Agnico Eagle) at the Doris and Madrid Sites (the Sites) from October 2022 to April 2023 (Winter 2022 – 2023). The monitoring program is outlined in the Air Quality Management Plan (AQMP; TMAC 2016, 2019). To calculate annual average concentrations for requisite parameters, data from May to September 2022 (already reported by Agnico Eagle in the Q1-Q3 2022 Ambient Monitoring Report (Nunami Stantec, 2023)) were also utilized in this report.

Monitoring around the Doris and Madrid Sites continued using the same methods/locations as in previous years.

The Winter 2022 – 2023 monitoring program included the following:

- Snow core sampling for dustfall at six locations in the vicinity of the Doris Site and nine locations in the vicinity of the Madrid Site utilizing snow cores over the period October 18, 2022, to April 14-16, 2023.
- Total Suspended Particulate (TSP) and particulate less than 2.5 microns ( $PM_{2.5}$ ) using continuous monitors at one location at the Doris site.
- Nitrogen Dioxide ( $NO_2$ ) using a continuous monitor at one location at the Doris site.
- Meteorological monitoring for wind speed, wind direction, temperature, relative humidity, snowfall, rainfall, solar radiation, and barometric pressure at one location. The meteorological data were used in the interpretation of the air quality measurements.

The results of the Winter 2022 – 2023 ambient monitoring were compared to:

1. Relevant ambient air quality Standards, Objectives and Guidelines (SOGs)
2. Dustfall predictions downwind of the Tailings Impoundment Area (TIA) included in the 2016 Doris North Project Certificate and Type A Water License Amendment Application (the 2016 Amendment)
3. The Madrid Project dispersion model predictions for dustfall presented in the Final Environmental Impact Statement (FEIS) Air Quality Assessment (Nunami Stantec, 2017)

A summary of the results and conclusions of the Winter 2022 – 2023 compliance monitoring program are presented in Table I.

# 1 Introduction

This report presents the results of ambient air quality, dustfall, nitrogen dioxide ( $\text{NO}_2$ ) and meteorological monitoring conducted by Agnico Eagle Mines Ltd. (Agnico Eagle) at the Doris and Madrid Sites (the Sites) from October 2022 to April 2023 (Winter 2022 – 2023). The monitoring program is outlined in the Air Quality Management Plan (AQMP; TMAC 2016, 2019). To calculate annual average concentrations for requisite parameters, data from May to September 2022 (already reported by Agnico Eagle in the Q1-Q3 2022 Ambient Monitoring Report (Nunami Stantec, 2023) were also utilized in this report.

Agnico Eagle commissioned a new continuous monitor measuring  $\text{NO}_2$  at the Doris site in October 2021.

The Winter 2022 – 2023 monitoring program included the following:

- Snow core sampling for dustfall at six locations in the vicinity of the Doris Site utilizing snow cores over the period October 18, 2022 (first snow fall with consistent sub-zero temperature) to April 14–16, 2023.
- Snow core sampling for dustfall at nine locations in the vicinity of the Madrid Site utilizing snow cores over the period October 18, 2022, to April 14–16, 2023.
- TSP and  $\text{PM}_{2.5}$  using continuous particulate monitors at one location at the Doris site.
- $\text{NO}_2$  using a continuous monitor at one location at the Doris site.
- Meteorological monitoring for wind speed, wind direction, temperature, relative humidity, snowfall, rainfall, solar radiation, and barometric pressure at one location. The meteorological data were used in the interpretation of the air quality measurements.

No dustfall jar sampling is conducted during the winter period.

In accordance with Term and Condition 28 of Nunavut Impact Review Board (NIRB) Project Certificate No.003, Agnico Eagle maintains the Hope Bay Project Noise Abatement and Monitoring Plan (TMAC, December 2017) which requires environmental noise monitoring programs to be conducted during each project stage: pre-construction (baseline), construction, operation, and reclamation. Baseline and construction noise monitoring has been conducted and operations monitoring will be conducted at an appropriate timeframe during operations. No additional noise monitoring under the Hope Bay Project Noise Abatement and Monitoring Plan was conducted during the winter 2022 – 2023 period that was the subject of this report.

The results of the Winter 2022 – 2023 ambient monitoring were compared to:

- Relevant ambient air quality Standards, Objectives and Guidelines (SOGs);
- Dustfall predictions downwind of the Tailings Impoundment Area (TIA) included in the 2016 Doris North Project Certificate and Type A Water License Amendment Application (the 2016 Amendment); and,

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 1: Introduction  
October 30, 2023

---

- The Madrid Project dispersion model predictions for dustfall presented in the Final Environmental Impact Statement (FEIS) Air Quality Assessment (Nunami Stantec, 2017).

Madrid North activities in winter 2022 – 2023 corresponds with the operations phase air quality assessment presented in the Madrid-Boston Project 2017 FEIS (Nunami Stantec, 2017), so this study was used for comparison to the Madrid measurements. Activities at the Doris Site in winter 2022–2023 most closely correspond to the operations phase of the Madrid-Boston Project, so the Doris measurements were compared to the 2017 FEIS and the 2016 Amendment modelling of TIA deposition. Operations at both the Doris and Madrid North sites have been reduced in 2022 – 2023 due to the mine being placed in temporary Care and Maintenance.

## **2      Ambient Monitoring Data Comparisons**

The results of the Winter 2022 – 2023 ambient monitoring were compared to relevant air quality standards, objective and guidelines and Doris / Madrid Sites dispersion modelling studies, as detailed in the following sections.

### **2.1    Air Quality Standards, Objectives and Guidelines**

Ambient air quality Standards, Objectives and Guidelines (SOGs) have been developed by the Canadian federal government and individual provinces and territories to assist or mandate the management of common air contaminants.

The assessment incorporates the Nunavut Environmental Guideline for Ambient Air Quality (Government of Nunavut 2011). Nunavut does not have guidelines or standards for some of the air contaminants. In these cases, guidelines, objectives, or standards from the federal government (CCME 2016, 2020), British Columbia (BC) government (BC MOE 2016) and Alberta government (Alberta Environment and Parks 2019) have been used.

The ambient air quality SOGs that are used in this report are summarized in Table 2-1.

### **2.2    Dispersion Model Prediction Comparisons**

Air quality dispersion models employ assumptions to simplify the random behaviour of the atmosphere into short periods of average behaviour. These assumptions limit the capability of the model to replicate every individual meteorological event. To compensate for these simplifications, a full year of meteorological data are applied to evaluate a wide range of possible conditions. Regulatory models are also designed to have a bias toward over estimation of contaminant concentrations (e.g., to be conservative under most conditions).

The 2017 FEIS modelling is expected to be conservative because the emission rates used in the modeling were conservatively estimated based on a combination of emission factors, engineering estimates and maximum production levels, and the dispersion modeling is expected to be conservative. The dispersion modelling utilized a maximum emissions scenario that was expected to result in the maximum predicted concentration of each contaminant outside of the modelled property boundary. On a day-to-day basis, the actual Doris-Madrid operations will likely differ from the maximum emissions scenario and therefore measured concentrations may differ from the model predictions for the location of the monitor.

## Winter 2022-2023 Atmospheric Compliance Monitoring Program Report

Section 2: Ambient Monitoring Data Comparisons  
October 30, 2023

### 2.2.1 Doris Site

During winter 2022 – 2023 Doris site had reduced operations. In October 2021 Agnico Eagle stopped Doris milling operations. In February 2022, Agnico Eagle announced its decision to place the Doris Mine into Care and Maintenance and suspend production at the Hope Bay Project. Of the scenarios assessed for the Doris site in the 2017 FEIS (construction and operation), these activities more closely correspond to the operations phase of the Madrid-Boston Project (as the construction scenario considered the Doris site operating plus construction activities that would generate additional emissions relative to the operations scenario). The 2017 FEIS predicted deposition rates in the vicinity of the monitors varied between 7.4 and 25.7 mg/100 cm<sup>2</sup>/30-days.

The 2016 Doris North Project Certificate and Type A Water License Amendment Application (the 2016 Amendment) also contained predictions for dustfall. The Amendment predicted that Tailings Impoundment Area (TIA) maximum monthly dustfall contributions (modelled over three years) would be more than 53 mg/100-cm<sup>2</sup>/30-days up to 250 m from the TIA and would drop to 2.1 mg/100-cm<sup>2</sup>/30-days at approximately 1 km from the TIA. These predictions were for dustfall resulting from the subaerial deposition of tailings in the TIA only and did not include dust emissions from any other sources (e.g., unpaved roads) or project phases (e.g., construction), nor did these predictions include background (non-project related) dust contributions.

Dustfall measurements for the Doris Site were compared to the 2016 Amendment/2017 FEIS modelling for dustfall locations downwind of the TIA and the 2017 FEIS modelling for all other dustfall locations. Maximum Doris site FEIS predictions for TSP PM<sub>2.5</sub> and NO<sub>2</sub> are presented in Table 2-1.

**Table 2-1: Ambient Air Quality Standards, Objective and Guidelines Compared to the 2017 FEIS Predictions**

### 2.2.2 Madrid Site

Dustfall measurements made in the vicinity of the Madrid North site (under reduced operations in Winter 2022 – 2023) were compared to operations predictions made in the air quality modelling study in the 2017 FEIS for the Madrid-Boston Project (Nunami Stantec, 2017). Operations phase dustfall predictions in the 2017 FEIS at the locations of the Madrid dust fall monitoring sites ranged from 10.6 to 54 mg/100-cm<sup>2</sup>/30-days.

## **3 Monitoring Program Description**

### **3.1 Monitoring Siting Criteria**

Nunavut does not have established siting requirements for ambient air samplers. Therefore, the siting criteria from the BC MoE (BC MoE 2009) and the United States Environmental Protection Agency (US EPA 1999, 2009) were used. The monitoring locations were selected based on the following criteria:

- A stable 120 VAC power source is available (for continuous monitoring)
- The sampler is not in an area of future infrastructure development
- The sampler inlet is mounted at a height of 2 to 15 m above ground level (for continuous monitoring)
- The locations are accessible year-round
- The sampler is away from structures, vegetation, and topographic features
- Dustfall samplers are sited up and down wind of the surface facilities and zones of high activity, considering the dominant wind direction during the summer months
- The samplers are more than 20 m away from structures, vegetation, and topographic features

### **3.2 Dustfall**

Dustfall is the measure of airborne particulate that has settled onto a given surface. The main dust generation sources will be from wind erosion from tailings facilities, the use of the crushers, and the movement of vehicles and large equipment on site. The dustfall monitoring program measures the quantities of dust deposited near project sites. Dustfall is monitored using dustfall canisters in the summer and by snow core sampling in the winter. Results of the monitoring program can be used to modify dust management procedures at the site, if required. Since dustfall measurements are a non-continuous methodology requiring laboratory analysis, the sampling is only used to retroactively confirm the effectiveness of mitigation measures. Real-time dust management on the site is carried out through application of water or approved chemical dust suppressants based on on-site observations of dust generation.

#### **3.2.1.1 Doris Dustfall**

Dustfall monitoring at the Doris site is undertaken at six locations, including a control station. The reasons for each selected location are provided in Table 3-1 and shown in Figure 3-1.

**Table 3-1: Reasons for Doris Site Dustfall Sampling Locations**

Station	Reason for Selected Location	UTM Coordinates (Zone 13W)		Elevation (m above mean sea level)
		Easting (m)	Northing (m)	
DFA1	This location has historical data and represents dustfall from the general site area, is located downwind of crushing activities, and close to the camp and mill site.	433731	7559047	28
CDF4	This station is located approximately 200 m away from Quarry 2, where crushing activities occur, to monitor dustfall from crushing activities.	432616	7558982	80
TIA-DF1	This station is located approximately 250 m downwind of the TIA tailings beach at a distance which corresponds with the maximum predicted monthly Project-generated dustfall of 53 mg/100-cm <sup>2</sup> /30-days in the 2016 Amendment.	435881	7556806	51
TIA-DF2	This station is located approximately 1.65 km downwind (east) of the TIA tailings beach. This location is approximately 300 m west (upwind) of the location predicted to have a maximum annual TIA-generated dustfall level of 23 mg/100-cm <sup>2</sup> /year (1.9 mg/100-cm <sup>2</sup> /30-days) in the 2016 Amendment.	437318	7557017	46
TIA-DF3	This station is located approximately 3 km downwind of the TIA tailings beach at a distance which corresponds with minimal annual predicted Project-generated dustfall.	438574	7557252	23
ControlDF	This station is located well away from potential project contributions and represents background conditions. The station is approximately 2 km southwest of Windy Camp.	430993	7549219	35

## Winter 2022-2023 Atmospheric Compliance Monitoring Program Report

Section 3: Monitoring Program Description  
October 30, 2023

### 3.2.1.2 *Madrid Dustfall*

Dustfall monitoring stations around the Madrid site were installed in the Spring of 2019. Dustfall monitoring was undertaken at nine locations around the Madrid North and Madrid South locations, including a control station in the predominantly upwind location and three locations to quantify dustfall with perpendicular distance from the Doris-Madrid Road. The reasons for each selected location are provided in Table 3-2 and are shown in Figure 3-2.

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 3: Monitoring Program Description  
October 30, 2023

---

### **3.2.2 Sampling Methods**

Dustfall collection is a passive monitoring method which provides a measure of particulates that would be directly deposited onto vegetation or soil. The basis of the methodologies is that field-deposited dust is collected in a manner that is quantifiable in terms of area ( $\text{cm}^2$ ) and exposure length (days), and that samples are then sent to a laboratory for analysis. Dustfall is monitored at each station via dustfall canisters during the summer and through snow core sampling in the winter.

Snow core sampling for the Doris site was instituted in 2016 to record dustfall during the winter months due to issues with using the canister method during winter months. Snow core sampling was implemented at the Madrid dustfall stations starting in Winter 2019-2020. At each dustfall station, snow core subsamples are collected using a snow corer to retrieve a cylindrical snow core from the snowpack. A minimum of three snow cores are collected along a transect at each monitoring location. The samples are composited in the field to produce a single representative composite snow sample for the location. Composite samples are bagged, labelled, and shipped to an accredited laboratory (ALS Laboratory Group (ALS)) for processing. Processing of snow cores require filtration, drying and weighing in the laboratory. For quality assurance/quality control (QA/QC), a duplicate sample is collected from one of the snow core sampling locations.

In the event that the snow depth is insufficient at a location to collect a snow core sample, a bucket method is used. This entails collecting scoop samples through the entire depth of the snow and depositing them into a pre-weighed bucket of known dimensions, measuring the weight of the snow sample and then bagging, labelling and shipping the sample to the laboratory.

Snow core samples are analyzed by the laboratory as water samples and are reported in units of mg/L. These units are converted to dustfall units of mg/100- $\text{cm}^2$  and standardized to mg/100 $\text{cm}^2$ /30-days over the monitoring period. The surface loading rate was calculated by multiplying the parameter concentration (mg/L or mg/1000  $\text{cm}^3$ ) by the average snow-water-equivalent of the transect samples (measured in cm of water) and dividing by the number of days snow had accumulated (time from the first snowfall to the sampling day).

The accuracy of the snow core sampling method is dependent on a number of factors including; accurately determining the length of time over which the sampled snow on ground had been accumulating, snow drifting affecting particulate accumulations, and potential contamination/disturbance of the snow pack by wildlife or human activity. Dustfall measurements using snow core sampling should therefore be considered approximate with comparisons to regulatory criteria made for informational purposes only.

### **3.2.3 Data Analysis**

Standardized dustfall is compared to the Alberta AAQO for dustfall (Table 2-1) as Nunavut does not currently have a dustfall standard. Analysis of temporal trends is undertaken to identify any trends in the measured dustfall levels with time of year or meteorological conditions. A qualitative comparison to the 2017 FEIS and 2016 Amendment predictions was also made. Review of dustfall levels with distance from the tailings management areas was also made to determine spatial trends in dustfall.

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 3: Monitoring Program Description  
October 30, 2023

---

### **3.2.4 Schedule**

Winter dustfall is collected at the end of winter (late April/early May). The snow core composite sample reflects cumulative winter dust deposition since the date of first snowfall to remain on ground to the sampling period end (approximately October through May, inclusive).

## **3.3 Suspended Particulate Monitoring (PM<sub>2.5</sub> and TSP)**

Suspended particulate matter includes both airborne solid and low-vapour-pressure liquid particles having aerodynamic diameters ranging in size from 0.01 to about 44 µm. The generation of particulate matter results from the movement of vehicles, mobile equipment, crushing, blasting, bulk handling and storage and other activities associated with mineral processing and construction. Wind erosion from sources such as tailings can also generate particulate emissions.

### **3.3.1 Sample Location**

Sampling is conducted at monitoring location DFA1 in the Doris site. This location is free from obstructions and nearby pollutant sources that may cause interference in suspended particulate monitoring.

### **3.3.2 Sampling Methods**

At the Doris site, ambient particulate monitoring for TSP and PM<sub>2.5</sub> in Winter 2022 – 2023 used Thermo Scientific 5014i continuous particulate monitors following the protocols described in the 2019 version of the Agnico Eagle AQMP (TMAC, 2019). The Thermo Scientific monitors are housed inside a temperature-controlled shelter to ensure the monitors are maintained within their required operating temperature range.

The instruments are calibrated and maintained following Environment and Climate Change Canada (ECCC) protocols given in the document National Air Pollution Surveillance Network Quality Assurance and Quality Control Guidelines (ECCC 2004).

Agnico Eagle technicians visit the station bi-weekly and perform checks to ensure the equipment is working properly.

### **3.3.3 Data Analysis**

Data collected from the continuous monitors were screened for any suspicious data including outliers, instrumentation drift and missing data. The particulate sampling provides 24-hour average ground-level concentrations for each size fraction. These were compared to the relevant 24-hour and annual standards (Table 2-1). In addition, temporal trends of the TSP and PM<sub>2.5</sub> ambient concentrations were examined, taking into consideration the time of year and meteorological conditions during the sampling period.

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 3: Monitoring Program Description  
October 30, 2023

---

### **3.3.4 Schedule**

The Thermo Fisher Scientific Model 5014i Beta Monitors operate continuously, collecting hourly average particulate concentrations.

## **3.4 Nitrogen Dioxide (NO<sub>2</sub>) Monitoring Program**

### **3.4.1 Sampling Location**

Sampling is conducted at monitoring location DFA1 in the Doris site. This location is free from obstructions and nearby pollutant sources that may cause interference in suspended particulate monitoring.

### **3.4.2 Sampling Methods**

Ambient NO<sub>2</sub> is measured using a Thermo Scientific 42qi continuous NOx monitor following the protocol described in the 2019 version of the Agnico Eagle AQMP (TMAC, 2019). The NO<sub>2</sub> monitor is housed inside the same temperature-controlled shelter as the two continuous particulate monitors to ensure the monitors are maintained within their required operating temperature range.

The instrument is calibrated and maintained following Environment and Climate Change Canada (ECCC) protocols given in the document National Air Pollution Surveillance Network Quality Assurance and Quality Control Guidelines (ECCC 2004).

### **3.4.3 Data Analysis**

Data collected from the continuous monitor was screened for any suspicious data including outliers, instrumentation drift and missing data. The NO<sub>2</sub> monitor currently records 5-minute average concentrations that were then averaged to produce hourly, daily, and annual average concentrations following ECCC protocols. The results were compared to the relevant 1-hour, 24-hour and annual standards (Table 2-1).

### **3.4.4 Schedule**

The Thermo Scientific 42qi operates continuously, collecting 5-minute average NO<sub>2</sub> concentrations.

## **3.5 Meteorological Monitoring Program**

The Doris meteorological station has recorded air temperature, relative humidity, wind speed and direction, precipitation, and solar radiation since 2004. Barometric pressure has been recorded since 2010. In September 2016, a Geonor T-200B all-weather precipitation gauge was installed to collect precipitation year-round.

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 3: Monitoring Program Description  
October 30, 2023

---

### **3.5.1 Sampling Location**

The meteorological station was chosen in consultation with Environment Canada and Health Canada officials and is located at UTM coordinates 432840 E, 7549835 N (Zone 13W).

### **3.5.2 Sampling Methods**

The meteorological station is a self-contained, solar/battery-powered system and includes instrumentation to measure hourly values of temperature, wind speed, wind direction, relative humidity, solar radiation, and rainfall. Data is recorded by a data logger located at the station and is downloaded manually.

### **3.5.3 Data Analysis**

Meteorological data are analyzed on a monthly basis and compiled into summary tables. Data validity checks are conducted and missing / invalid data are flagged. For the Winter 2022 – 2023 period, 58 hours of wind speed and wind direction data were invalidated due to calibration/maintenance activities or icing of the sensor. No total precipitation data for the Winter 2022 – 2023 period was recorded due to a malfunction of the Geonor sensor. The Goenor sensor was replaced on July 3, 2023. The data recovery rates for all other meteorological instruments in this period were better than 94%.

### **3.5.4 Schedule**

Meteorological data is collected continuously and is downloaded at the beginning of each month, or on an as-needed basis.

## Winter 2022-2023 Atmospheric Compliance Monitoring Program Report

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

# 4 Monitoring Program Results and Discussion

## 4.1 Snow Core Dustfall Results

### 4.1.1 Doris Site

The measurement period for each snow core sample at the Doris Site is provided in Table 4-1. Measured dustfall rates estimated for each monitoring location in 2022 – 2023 are summarized in Table 4-2. Laboratory results are presented in Appendix A.

**Table 4-1: Snow Core Sampling Periods – Doris Site**

Snow Core Station	Date of First Snowfall <sup>a</sup>	Sample Date	Sample Time (days)
CDF4	10/18/2022	4/16/2023	180
DFA1		4/16/2023	180
TIA-DF1		4/16/2023	180
TIA-DF2		4/16/2023	180
TIA-DF3		4/16/2023	180
ControlDF		4/16/2023	180

Note:

a: SOURCE: Environment and Climate Change Canada's Cambridge Bay Meteorological Station

**Table 4-2: Measured Deposition Rates from Snow Core Sampling – Doris Site**

Snow Core Station	Alberta Ambient Air Quality Objective (AAAQO) (mg/100-cm <sup>2</sup> /30-days)	Measured Dustfall Level (mg/100-cm <sup>2</sup> /30-days)	Percentage of AAAQO (Commercial and Industrial Area)
CDF4	158 (commercial and industrial areas)	33.4	21%
DFA1		38.4	24%
TIA-DF1		5.9	4%
TIA-DF2		8.8	6%
TIA-DF3		3.6	2%
ControlDF		5.8	4%

Dustfall levels estimated from the snow core sampling ranged from 3.6 mg/100-cm<sup>2</sup>/30-days (at TIA-DF3) to 38.4 mg/100-cm<sup>2</sup>/30-days (at DFA1) during the October 2022 to April 2023 monitoring period (180 days). All measured dustfall levels are less than the AAAQO of 158 mg/100-cm<sup>2</sup>/30-days for commercial and industrial areas. The maximum measured dustfall (38.4 mg/100-cm<sup>2</sup>/30 days) occurred at Station DFA1 which is located east of the mill site.

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

---

The dustfall measurements at locations TIA-DF1, TIA-DF2 and TIA-DF3 (monitoring locations downwind of the TIA) are consistent with the predicted dustfall level in the 2016 Amendment modelling of <53 mg/100 cm<sup>2</sup>/30-days outside of 250 m from the TIA. Dustfall rates at locations TIA-DF1, TIA-DF2, TIA-DF3, DFA1 and ControlDF were either below the 2017 FEIS predictions or within the expected range of variability for dispersion modelling predictions. The measurement at CDF4 was greater than the 2017 FEIS modelling however, the field records for this sample note that there were fox tracks and artic hare feces in the vicinity of the station. The measured total suspended solids at CDF4 were anomalously high, which is consistent with the snow sample being contaminated by animal activities. The measurement at DFA1, while within the range of the 2017 FEIS model predictions, also appears to be anomalous as there have been reduced operations since the Facility was placed in care and maintenance and production suspended in February 2022.

### **4.1.2 Madrid Site**

The measurement period for each snow core sample at the Madrid Site is provided in Table 4-3. Measured dustfall rates estimated for each monitoring location in Winter 2022 – 2023 are summarized in Table 4-4. Laboratory results are presented in Appendix A. Snow core measurements were collected from all Madrid locations in Winter 2022 – 2023.

**Table 4-3: Snow Core Sampling Periods – Madrid Site**

Snow Core Station	Date of First Snowfall <sup>a</sup>	Sample Date	Sample Time (days)
MDF01	10/18/2022	4/14/2023	178
MDF02		4/14/2023	178
MDF03		4/14/2023	178
MDF04		4/14/2023	178
MDF05		4/15/2023	179
MDF06		4/15/2023	179
MDF07		4/15/2023	179
MDF08		4/15/2023	179
MDF09		4/15/2023	179

Note:

a: SOURCE: Environment and Climate Change Canada's Cambridge Bay Meteorological Station

## Winter 2022-2023 Atmospheric Compliance Monitoring Program Report

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

**Table 4-4: Measured Deposition Rates from Snow Core Sampling – Madrid Site**

Snow Core Station	Alberta Ambient Air Quality Objective (AAAQO) (mg/100-cm <sup>2</sup> /30-days)	Measured Dustfall Level (mg/100-cm <sup>2</sup> /30-days)	Percentage of AAAQO (Commercial and Industrial Area)
MDF01	158 (commercial and industrial areas)	8.9	6%
MDF02		2.8	2%
MDF03		3.8	2%
MDF04		6.8	4%
MDF05		2.4	2%
MDF06		4.0	3%
MDF07		16.3	10%
MDF08		4.4	3%
MDF09		14.6	9%

Dustfall levels estimated from the snow core sampling ranged from 2.4 mg/100-cm<sup>2</sup>/30-days (at MDF05) to 16.3 mg/100-cm<sup>2</sup>/30-days (MDF07) during the October 2022 to April 2023 monitoring period (178 – 179 days). All measured dustfall levels were less than the AAAQO of 158 mg/100-cm<sup>2</sup>/30-days for commercial and industrial areas. The maximum deposition rate (16.3 mg/100-cm<sup>2</sup>/30-days) occurred at Station MDF07 which is 50 m east of Doris-Madrid All-Weather Road.

The dustfall rates from all Madrid Site monitoring stations were less than the maximum predicted dustfall level at each location in the 2017 FEIS modelling.

## 4.2 Particulate Matter Monitoring

TSP and PM<sub>2.5</sub> ambient monitoring is conducted at location DFA1. A summary of the measured ambient TSP and PM<sub>2.5</sub> concentrations for the study period are presented in Table 4-5. Table 4-6 provides a summary of the data recovery rates for the reporting period. Calibration records are presented in Appendix B.

## Winter 2022-2023 Atmospheric Compliance Monitoring Program Report

Section 4: Monitoring Program Results and Discussion  
 October 30, 2023

---

**Table 4-5: Summary of Ambient TSP and PM<sub>2.5</sub> Measurements**

Parameter	Air Quality Standard / Objective		24-Hour Average ( $\mu\text{g}/\text{m}^3$ )				Annual Average ( $\mu\text{g}/\text{m}^3$ )	
	24-Hour	Annual	Maximum <sup>a</sup>	98 <sup>th</sup> Percentile <sup>b</sup>	Range	% of Criteria	Average <sup>c</sup>	% of Criteria
TSP	120	60	46.2		2.0 - 46.2	39%	N/A	N/A
PM <sub>2.5</sub>	27	8.8	16.6	11.5	0 – 16.6	43%	N/A	N/A

Notes:

a: Results reported for October 2022 to April 2023

b: Results reported for May 2022 to April 2023

c: Data recovery rate below target for calculating a valid annual average.

**Table 4-6: Summary of Data Recovery Rates for Continuous Particulate Sampling**

Month	Data Recovery Rate (%)	
	TSP	PM <sub>2.5</sub>
October 2022	0%	0%
November 2022	73%	77%
December 2022	42%	45%
January 2023	71%	74%
February 2023	61%	57%
March 2023	84%	77%
April 2023	73%	83%
Annual (May 2022 – April 2023)	63%	54%

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

---

### **4.2.1 TSP**

The annual (May 2022 to April 2023) data recovery rate for TSP was 63% which is below acceptable levels for calculating an annual average. The monthly recovery rates for the continuous TSP monitoring for Winter 2022 – 2023 were below the data recovery objective of 90% for the entire period due to intermittent downtime as operational complications were addressed by Agnico Eagle.

The maximum measured 24-hour average TSP concentration in the October 2022 to April 2023 period was 46.2  $\mu\text{g}/\text{m}^3$  which is 39% of the applicable Government of Nunavut (GN) air quality objective. This concentration is below the maximum predicted TSP concentration in the 2017 FEIS of 69.9  $\mu\text{g}/\text{m}^3$ .

TSP monitoring data for May - September 2022 which have been previously reported, were used in conjunction with the October 2022 – April 2023 TSP measurements. To calculate a valid annual average concentration, a data recovery rate of 75% is required. Since the data recovery rate was less than this target, a valid annual average concentration could not be calculated. Agnico Eagle is reviewing the monitoring data/instrument logs to assess potential causes of this issue and implement remedial measures. A time history plot of measured 24-hour average TSP concentrations for the period October 2022 to April 2023 is presented in Figure 4-1. TSP concentrations were low throughout the monitoring period.

### **4.2.2 PM<sub>2.5</sub>**

The annual (May 2022 – April 2023) PM<sub>2.5</sub> data recovery rate was 54% which is below acceptable levels for calculating an annual average. Monthly data recovery rates for the continuous PM<sub>2.5</sub> sampling were below the objective of 90% for the entire period due to operational issues.

The calculated 98<sup>th</sup> percentile of the measured 24-hour average PM<sub>2.5</sub> concentrations in the one-year period of May 2022 to April 2023 was 11.5  $\mu\text{g}/\text{m}^3$  which is below the Canadian Ambient Air Quality Standard (CAAQS) of 27  $\mu\text{g}/\text{m}^3$ . An explicit comparison to the CAAQS for PM<sub>2.5</sub> requires averaging the 98<sup>th</sup> percentile daily average levels in each of three consecutive calendar years, with a valid comparison requiring valid data for a minimum of two of the three years. Since the data presented in this report is for a single year and is not based on a calendar year, comparison to the CAAQS is provided for informational purposes only; not to assess compliance. The 98<sup>th</sup> percentile of the measured 24-hour average PM<sub>2.5</sub> concentrations is less than the maximum predicted 98<sup>th</sup> percentile PM<sub>2.5</sub> concentration in the 2017 FEIS of 12.1  $\mu\text{g}/\text{m}^3$ .

Similar to TSP, the annual data recovery rate for PM<sub>2.5</sub> was less than the target, thus a valid annual average concentration could not be calculated.

A time history plot of measured 24-hour average PM<sub>2.5</sub> concentrations for the period October 2022 to April 2023 is presented in Figure 4-2. PM<sub>2.5</sub> concentrations were generally low throughout the winter 2022 – 2023 period.

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

---

### **4.2.3 Trends in Ambient Particulate**

Table 4-7 below provides a comparison of maximum measured 24-hour and annual average TSP and PM<sub>2.5</sub> measurements over the last three winter periods. The similar maximum 24-hour average TSP concentrations were measured in winter 2021-2022 and 2022-2023 and were 39% of the Guideline. The highest measured 24-hour average PM<sub>2.5</sub> concentration occurred in winter 2021-2022 and was 61% of the guideline.

**Table 4-7: Summary of Measured TSP/PM<sub>2.5</sub> Concentrations for 2020 – 2023**

Contaminant	Averaging Period	Criteria	Oct 2020 – Apr 2021	Oct 2021 – Apr 2022	Oct 2022 – Apr 2023
TSP	24-hour	120	36.7	46.1	46.2
	Annual <sup>a</sup>	60	5.2	9.0	N/A
PM <sub>2.5</sub>	24-hour	27	6.9	16.6	11.5
	Annual <sup>a</sup>	8.8	1.9	3.5	N/A

Notes:

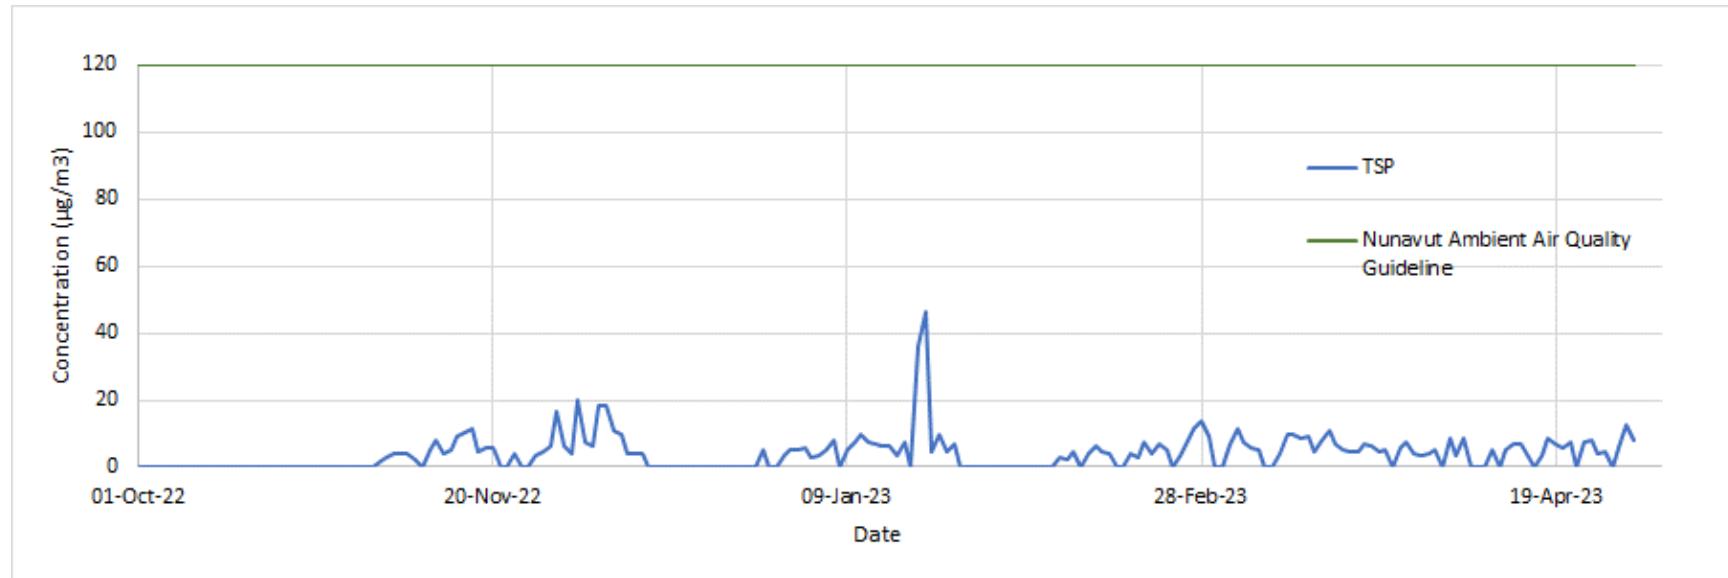

a: Data recovery rate below target for calculating a valid annual average.

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

### 4.3 Nitrogen Dioxide (NO<sub>2</sub>)

The annual data recovery rate for NO<sub>2</sub> was 84% which is above acceptable levels for calculating an annual average concentration. The results are compared to the relevant hourly, daily, and annual standards in Table 4-8.

**Table 4-8: Summary of NO<sub>2</sub> Monitoring Results**

Averaging Period	Units	Air Quality Standard/Objective	Agency	Measured Value	% of Criteria
1-hour <sup>a</sup>	ppb	212	Nunavut Ambient Air Quality Guidelines	30.1	14%
24-hour <sup>a</sup>	ppb	106		16.1	15%
Annual <sup>b</sup>	ppb	32		1.2	4%
1-hour (98 <sup>th</sup> percentile) <sup>b</sup>	ppb	60	CAAQS	24.8	N/A <sup>c</sup>
Annual <sup>b</sup>	ppb	12		1.2	N/A <sup>d</sup>

Notes:

a: Results reported for October 2022 to April 2023

b: Results reported for May 2022 to April 2023

c: Comparison to the CAAQS requires a minimum of two years of data over calendar years.

d: Comparison to the CAAQS requires an average over a calendar year.

The maximum measured hourly average NO<sub>2</sub> concentration in the October 2022 to April 2023 period was 30.1 parts per billion (ppb) which is 14% of the applicable GN air quality objective and is less than the maximum predicted NO<sub>2</sub> concentration in the 2017 FEIS of 134 ppb. Likewise, measured daily and annual average NO<sub>2</sub> concentrations are well below the corresponding GN air quality objectives and FEIS predictions.

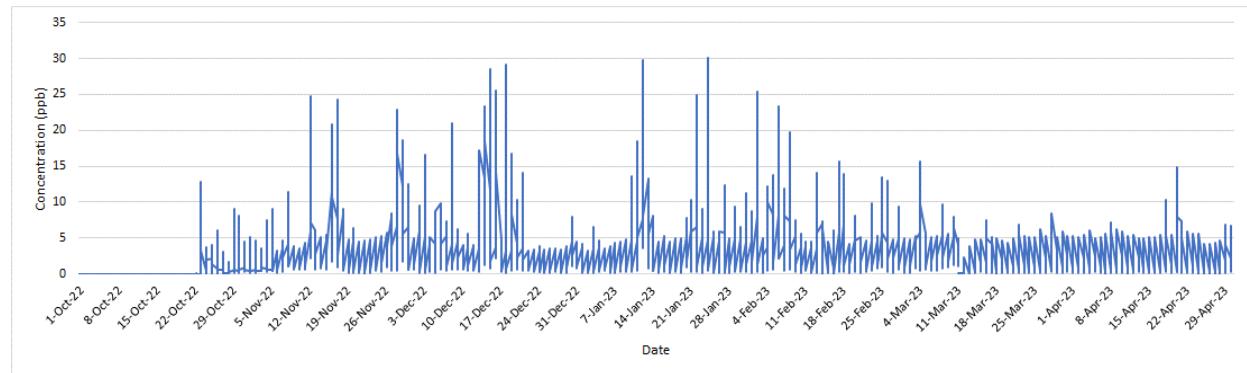

The calculated 98<sup>th</sup> percentile of the measured daily maximum 1-hour average NO<sub>2</sub> concentrations in the May 2022 to April 2023 period was 24.8 ppb which is below the Canadian Ambient Air Quality Standard (CAAQS) of 60 ppb. An explicit comparison to the CAAQS for NO<sub>2</sub> requires averaging the 98<sup>th</sup> percentile of the daily maximum 1-hour average levels in each of three consecutive calendar years, with a valid comparison requiring valid data for a minimum of two of the three years. Since the data presented in this report is for a single year and is not based on a calendar year, comparison to the CAAQS is provided for informational purposes only; not to assess compliance.

A time history plot of measured 1-hour average NO<sub>2</sub> concentrations for the period October 2022 to April 2023 is presented in Figure 4-3. NO<sub>2</sub> concentrations were generally low throughout the monitoring period.

## Winter 2022-2023 Atmospheric Compliance Monitoring Program Report

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

**Figure 4-3: Time History of Measured 1-hour Average NO<sub>2</sub> Concentrations (Oct 2022 - April 2023)**

## 4.4 Meteorology

A summary of the maximum, minimum, and average of the hourly average meteorological parameters in each month of October 2022 to April 2023 is presented in Table 4-9. Hourly meteorological data collected for the same period at the Doris station are presented in Appendix C.

A wind rose showing the measured directionality and speed for the period October 2022 to April 2023 is presented in Figure 4-4. The length of the radial bars gives the total percent frequency of winds from the indicated direction, while portions of the bars of different widths indicate the frequency associated with each wind speed category.

Winds over the seven-month period occurred predominantly from westerly and easterly directions. Higher wind speeds occurred most frequently from the west.

Winter 2022-2023 Atmospheric Compliance Monitoring Program Report

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

**Table 4-9: Summary of Meteorological Measurements (Oct 2022 – Apr 2023)**

Date	Average Air Temperature	Minimum Daily Air Temperature	Maximum Daily Air Temperature	Absolute Minimum Temperature	Absolute Maximum Temperature	Average Wind Speed	Maximum Instantaneous Wind Speed	Time of Maximum Instantaneous Wind Speed	Total Precipitation	Total Rainfall	Total Snow-Water Equivalent (SWE)	Average Relative Humidity	Average Solar Radiation	Total Bright Sunshine Hours	Station Pressure

Notes:

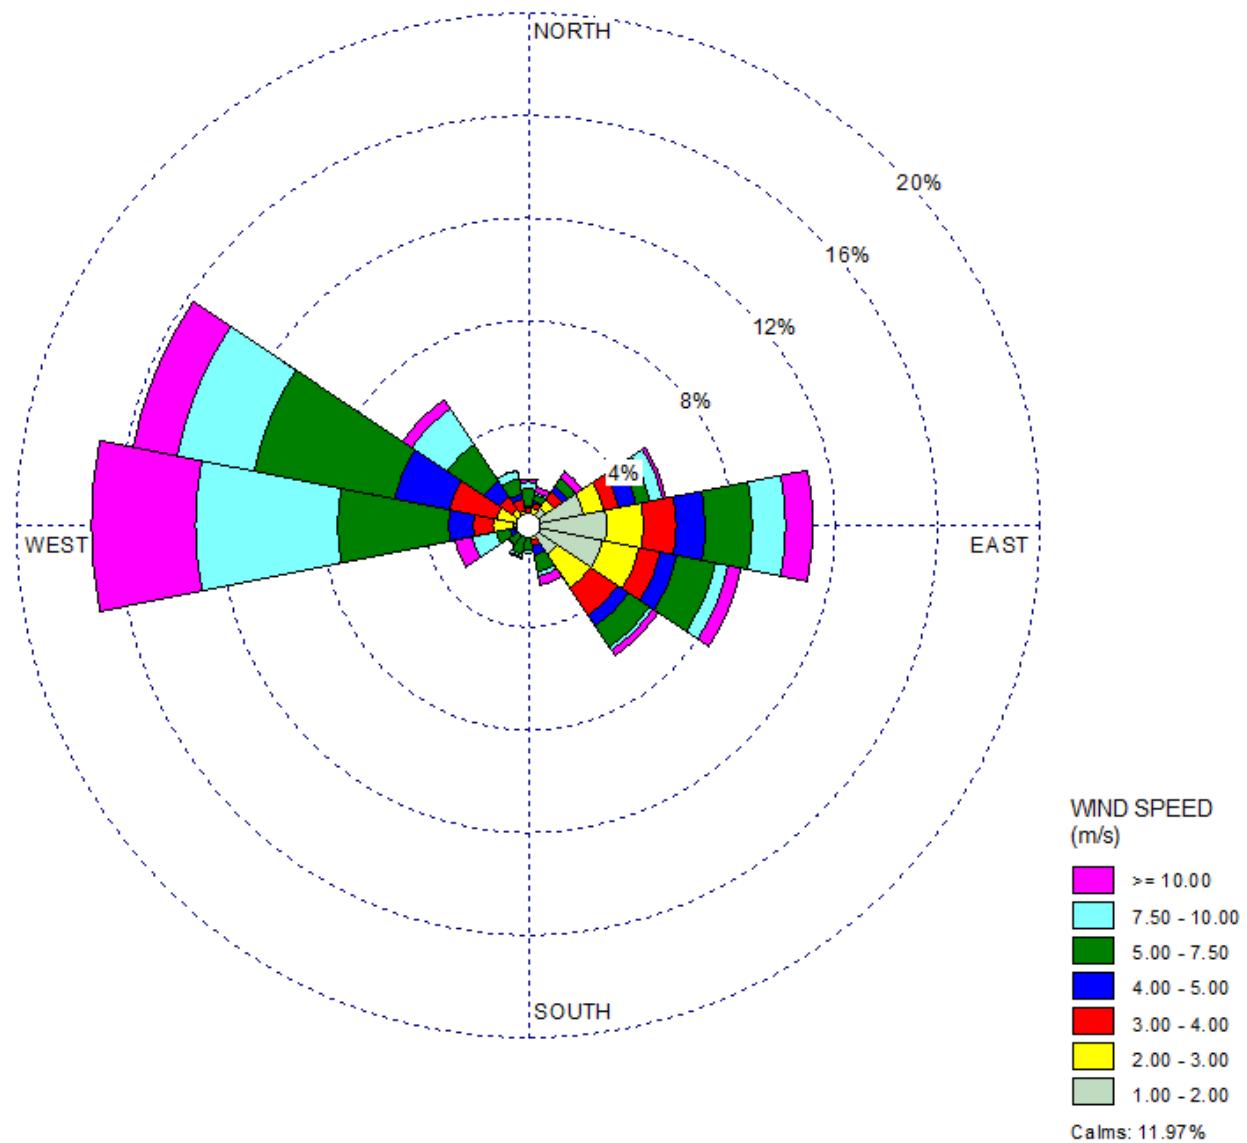

a: Monthly data capture rate is <75% - the monthly average is invalid.

b: Geonor malfunctioning - the data is noted as missing 'M'.

## Winter 2022-2023 Atmospheric Compliance Monitoring Program Report

Section 4: Monitoring Program Results and Discussion  
October 30, 2023

**Figure 4-4:** Wind Rose for October 2022 to April 2023

## **5      Conclusions**

This report presents the results of ambient air quality, dustfall, NO<sub>2</sub> and meteorological monitoring conducted at the Doris and Madrid Sites (the Sites) from October 2022 to April 2023 as outlined under the Air Quality Management Plan (AQMP; TMAC 2016, 2019). To calculate annual average concentrations for requisite parameters, data from May to September 2022 (already reported by Agnico Eagle in the Q1-Q3 2022 Ambient Monitoring Report (Nunami Stantec, 2023)) was also utilized and are included in this report.

The Winter 2022 – 2023 monitoring program included the following:

- Snow core sampling for dustfall at six locations in the vicinity of the Doris Site and at nine locations in the vicinity of the Madrid Site utilizing snow cores over the period October 18, 2022, to April 14-16, 2023.
- Monitoring of TSP and PM<sub>2.5</sub> using continuous monitors at one location at the Doris site.
- Monitoring of NO<sub>2</sub> using a continuous monitor at one location at the Doris site.
- Meteorological monitoring for wind speed, wind direction, temperature, relative humidity, snowfall, rainfall, solar radiation, and barometric pressure at one location. The meteorological data were used in the interpretation of the air quality measurements.

The main results and findings of the report are presented below.

### **Snow Core Dustfall Sampling – Doris Site**

- Dustfall levels estimated from the snow core sampling ranged from 3.6 mg/100-cm<sup>2</sup>/30-days (at TIA-DF3) to 33.4 mg/100-cm<sup>2</sup>/30-days (CDF4).
- The dustfall levels for all stations were below the AAAQO of 158 mg/100-cm<sup>2</sup>/30-days for commercial and industrial areas.
- Dustfall rates at locations TIA-DF1, TIA-DF2, TIA-DF3, DFA1 and ControlDF were either below the 2017 FEIS predictions or within the expected range of variability for dispersion modelling predictions. The measurement at CDF4 was greater than the 2017 FEIS modelling however the snow sample was likely contaminated by animal activities.

### **Snow Core Dustfall Sampling – Madrid Site**

- Dustfall levels estimated from the snow core sampling ranged from 2.4 mg/100-cm<sup>2</sup>/30-days (at MDF05) to 16.3 mg/100-cm<sup>2</sup>/30-days (at MDF07).
- All measured dustfall levels were less than the AAAQO of 158 mg/100-cm<sup>2</sup>/30-days for commercial and industrial areas.
- The dustfall rates for all Madrid Site monitoring stations were less than their maximum predicted dustfall level at each location in the 2017 FEIS modelling.

## **Winter 2022-2023 Atmospheric Compliance Monitoring Program Report**

Section 5: Conclusions  
October 30, 2023

---

### **Particulate Monitoring**

- The maximum measured 24-hour average TSP concentration was 46.2 µg/m<sup>3</sup> which is 39% of the applicable GN air quality objective. This concentration is below the maximum predicted TSP concentration in the 2017 FEIS of 69.9 µg/m<sup>3</sup>.
- The calculated 98<sup>th</sup> percentile of the measured 24-hour average PM<sub>2.5</sub> concentrations in the one-year period of May 2022 to April 2023 was 11.5 µg/m<sup>3</sup> which is below the CAAQS of 27 µg/m<sup>3</sup>.
- Annual average TSP and PM<sub>2.5</sub> concentrations could not be calculated due to the annual data recovery rates for both of these parameters being less than the required threshold.
- Both the maximum measured TSP concentration and the 98<sup>th</sup> percentile of the measured 24-hour average PM<sub>2.5</sub> concentrations were below the maximum predicted concentrations in the 2017 FEIS.

### **Nitrogen Dioxide Monitoring**

- The maximum measured 1-hour average NO<sub>2</sub> concentration was 30.1 ppb which is 14% of the applicable GN air quality objective. This concentration is below the maximum predicted NO<sub>2</sub> concentration in the 2017 FEIS of 134 ppb.
- The maximum measured daily and annual average NO<sub>2</sub> concentrations are well below the corresponding GN air quality objectives and FEIS predictions.
- The calculated 98<sup>th</sup> percentile of the measured daily maximum 1-hour average NO<sub>2</sub> concentrations in the one-year period of May 2022 to April 2023 was 24.8 ppb which is below the CAAQS of 60 ppb.

Section 6: Closure  
October 30, 2023

---

# **6 Closure**

This document entitled Winter 2022 – 2023 Atmospheric Compliance Monitoring Program Report for the Doris and Madrid Projects was prepared by Nunami Stantec Ltd. for the account of Agnico Eagle Mines Ltd. The material in it reflects Nunami Stantec's best judgment in light of the information available to it at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions made based on it, are the responsibilities of such third parties. Nunami Stantec Ltd. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

Respectfully Submitted,

**NUNAMI STANTEC LIMITED**

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

Unit	Description
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

## Sample Comments

Sample	Client Id	Comment
YL2300312-004	ControlDF-SNOW	Water sample for total mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

## Qualifiers

Qualifier	Description
DLM	<i>Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).</i>
RRV	<i>Reported result verified by repeat analysis.</i>

---

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

**Key**

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

---

### Workorder Comments

---

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

---

### Summary of Outliers

#### Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

#### Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

### ***Outliers : Analysis Holding Time Compliance (Breaches)***

- Analysis Holding Time Outliers exist - please see following pages for full details.

### ***Outliers : Frequency of Quality Control Samples***

- No Quality Control Sample Frequency Outliers occur.

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

## Legend & Qualifier Definitions

**EHTR-FM:** Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: Water

Evaluation: ✗ = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Analytical Methods	Method	QC Lot #	Count		Frequency (%)	
				QC	Regular	Actual	Expected
<b>Laboratory Duplicates (DUP)</b>							
Ammonia by Fluorescence		E298	908935	1	19	5.2	5.0

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

<b>Analytical Methods</b>	<b>Method / Lab</b>	<b>Matrix</b>	<b>Method Reference</b>	<b>Method Descriptions</b>
TSS by Gravimetry	E160 Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at $104 \pm 1^\circ\text{C}$ , with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at $180 \pm 2^\circ\text{C}$ for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)

Analytical Methods				
	Method / Lab	Matrix	Method Reference	Method Descriptions
Total metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	<p>Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p>
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO <sub>3</sub> ), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Preparation Methods				
	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.

## General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

### Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percent Difference

# = Indicates a QC result that did not meet the ALS DQO.

## Workorder Comments

Holding times are displayed as "—" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

## Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: Water

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: Water

## Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: Water

Quote number	: Hope Bay – Main Quote		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	Position	Laboratory Department
Alex Thornton	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Inorganics, Burnaby, British Columbia

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

Unit	Description
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

## Sample Comments

Sample	Client Id	Comment
YL2300313-003	M-DF03-SNOW	Water sample for total mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

---

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

**Key**

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

---

### Workorder Comments

---

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

---

### Summary of Outliers

#### Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

#### Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

### ***Outliers : Analysis Holding Time Compliance (Breaches)***

- Analysis Holding Time Outliers exist - please see following pages for full details.

### ***Outliers : Frequency of Quality Control Samples***

- No Quality Control Sample Frequency Outliers occur.

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

#### Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: Water

Evaluation: ✗ = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Analytical Methods	Method	QC Lot #	Count		Frequency (%)	
				QC	Regular	Actual	Expected
<b>Laboratory Duplicates (DUP)</b>							
Ammonia by Fluorescence		E298	908935	1	19	5.2	5.0

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

<b>Analytical Methods</b>	<b>Method / Lab</b>	<b>Matrix</b>	<b>Method Reference</b>	<b>Method Descriptions</b>
TSS by Gravimetry	E160 Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at $104 \pm 1^\circ\text{C}$ , with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at $180 \pm 2^\circ\text{C}$ for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)

Analytical Methods				
	Method / Lab	Matrix	Method Reference	Method Descriptions
Total metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	<p>Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p>
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO <sub>3</sub> ), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Preparation Methods				
	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.

## General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

### Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percent Difference

# = Indicates a QC result that did not meet the ALS DQO.

## Workorder Comments

---

Holding times are displayed as "—" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

---

## Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: Water

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: Water

## Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: Water
