Qablunaatitut: The B.I.G. (Before It's Gone) ExpeditionA 5-woman ski expedition from Borden Island to Isachsen on Ellef Rignes Island across the Prince Gustaf Adolf Sea, camping on sea ice and collecting small-volume surface snow, surface ice and water samples, as well as data for two citizen science studies. The expedition route is approximately 150km and is expected to take 10 days of ski travel. While acknowledging the impact our presence will have, the design of the expedition is intended to ensure minimal possible negative impact to environment, wildlife and people.Date of Expedition:10th April – 22nd April 2024Fieldwork to be undertaken: • SamplingAt five locations along the expedition route across the Prince Gustaf Adolf Sea the expedition will collect surface snow, surface ice and (where possible) water samples in 500ml containers. No motorized or power tools are used to collect the samples – only a scoop, an ice axe and a hand augur. Weather and snow conditions will be recorded at each sample location. • Data collection for citizen science studiesAt regular intervals throughout the expedition snow characteristics will be recorded and contributed to the Snow Scope platform to an open access, citizen science database. Data will also be gathered for the citizen science Globe Observer platform, an open access database recording Arctic cloud cover.Analysis:The snow, ice and water samples collected by the expedition team will be analysed at the University of Colorado in the US and at the National Oceanography Centre in the UK. The samples will be analysed for black carbon, microplastic and heavy metal content to explore the distribution by the atmosphere across the Arctic region of these materials generated in northern Europe and North America. Similar expedition projects have been completed in Svalbard, Greenland and Iceland.Output:• Dr Ulyana Horodyskyj Pena will be analysing samples for black carbon and the results will form part of a dataset she is compiling from remote regions across the world including K2 and Antarctica. The dataset will be made freely available online. Dr Horodyskyj Pena intends to use this dataset to generate published literature and it is hoped others working in this area of scientific investigations may also use this data in published literature. • Felicity Aston will be analysing the samples for microplastic and heavy metal content as part of her PhD studies at the University of Southampton. Her PhD project seeks to answer two questions: a) What are the source regions of microplastic and lead contaminants deposited via the atmosphere across the Arctic and what are the possible routes of transport from North America and Northern Europe? and b) What can be discovered about the cycling and incorporation of atmospheric deposition within sea ice? The results will be published as part of her thesis and associated literature. The results will be made freely available online and efforts are being made to identify ways in which any results and data may be shared usefully within Nunavut specifically

Uiviititut: L'Expédition B.I.G. (Before It's Gone / Avant qu'il ne soit trop tard) C'est une expédition à ski de cinq femmes qui partira de l'île Borden jusqu'à Isachsen sur l'île Ellef Ringnes en traversant la mer du Prince-Gustave-Adolf. L'expédition campera sur la banquise et collectera des échantillons, en petite quantité, de neige superficielle, de glace en surface et d'eau, ainsi que des données pour deux études de science citoyenne. Le parcours de l'expédition est d'environ 150 km et devrait prendre 10 jours de voyage à ski. Tout en reconnaissant l'impact de notre présence, la conception de l'expédition vise à minimiser autant que possible les impacts négatifs sur l'environnement, la faune et les personnes.Date de l'expédition : 10 avril – 22 avril 2024Travaux sur le terrain à réaliser : • Échantillonnage À cinq endroits le long du parcours de l'expédition à travers la mer du Prince-Gustave-Adolf, l'expédition collectera de la neige superficielle, de la glace en surface et (si possible) des échantillons d'eau dans des récipients de 500 ml. Aucun outil motorisé ou électrique n'est utilisé pour collecter les échantillons, seulement une pelle, une pioche à glace et une tarière manuelle. Les conditions météorologiques et de neige seront enregistrées à chaque emplacement d'échantillonnage. • Collecte de données pour des études de science citoyenne À intervalles réguliers tout au long de l'expédition, les caractéristiques de la neige seront enregistrées et contribueront à la plateforme Snow Scope, une base de données de science citoyenne en accès libre. Des données seront également recueillies pour la plateforme Globe Observer, une base de données en accès libre, enregistrant la couverture nuageuse arctique.Analyse : • Les échantillons de neige, de glace et d'eau collectés par l'équipe de l'expédition seront analysés à l'Université du Colorado aux États-Unis et au Centre National d'Océanographie au Royaume-Uni. Les échantillons seront analysés pour déterminer la présence de carbone noir, de microplastiques et de métaux lourds afin

d'explorer leur distribution dans l'atmosphère à travers la région arctique, provenant de l'Europe du Nord et de l'Amérique du Nord. Des projets d'expédition similaires ont été menés au Svalbard, au Groenland et en Islande. Résultats attendus : • Le Dr Ulyana Horodyskyj Pena analysera les échantillons de carbone noir, dont les résultats feront partie d'un ensemble de données qu'elle compile à partir de régions éloignées du monde entier, notamment le K2 et l'Antarctique. L'ensemble des données sera librement accessible en ligne. Le Dr Horodyskyj Pena prévoit d'utiliser cet ensemble de données pour générer des publications scientifiques et il est espéré que d'autres travaillant dans ce domaine d'investigations scientifiques pourraient également utiliser ces données dans des publications. • Felicity Aston analysera les échantillons pour déterminer la présence de microplastiques et de métaux lourds dans le cadre de ses études de doctorat à l'Université de Southampton. Son projet de doctorat vise à répondre à deux questions : a) Quelles sont les régions sources de microplastiques et de contaminants de plomb déposés via l'atmosphère dans l'Arctique et quelles sont les routes de transport possibles depuis l'Amérique du Nord et l'Europe du Nord ? et b) Que peut-on découvrir sur le cycle et l'incorporation des dépôts atmosphériques dans la glace de mer ? Les résultats seront publiés dans le cadre de sa thèse et des publications associées. Les résultats seront librement accessibles en ligne et des efforts sont déployés pour identifier des moyens de partager efficacement ces résultats et ces données au Nunavut spécifiquement.

Project transportation types

Transportation Type	Qanuq Atuqtauniarmangaa	Length of Use
Air	Chartered Twin Otter flights to and from Resolute Bay from start and end of ski journey	
Water	Ski expedition over sea ice	

Project accomodation types

Temporary Camp

Ihuaqtivaluin Atuqtauyukhan

Hanalrutit atuqtaunahuat (ukuallu ikuutat, pampiutainnik, tingmitinik, akhaluutinik, hunaluuniit)

Hanalrutit Qanurittuq	Qaffiuyut	Aktikkulaanga – Qanurittullu	Qanuq Atuqtauniarmangaa
Skis and sleds	5 sets	sleds (L 171.5cm, W 60cm, H 25cm); each ski between 170-195cm long and 15cm wide.	The expedition will travel on skis and tow expedition sledges carrying all their supplies and camping equipment.
Camping equipment	100kg	N/A	The 5-woman team will camp on the ice in two 4-man tents. Everything is as lightweight as possible and is transported in expedition sledges by ski.
Scientific equipment	5 x 77 liter boxes	Each box L 60cm, W 40cm, H 40cm	All scientific sampling equipment is manual. The equipment includes stainless steel bottles, polypropylene tubs, stainless steel sampling tools and tyvek clean-suits.
Twin Otter Aircraft DHC-6	2	Length 15.77m, Width 19.8m, Height 5.9m	Two Twin Otter Aircraft will be used to transport the expedition team and equipment from Resolute Bay to the expedition start point. One of these aircraft will collect the team, its equipment and scientific samples from the expedition endpoint at the end of the expedition for return to Resolute Bay.

Please see Environmental Impact Assessment in documents section for full list of potential impacts and mitigation measures. :- Noise – Plane engine noise , Emissions – aviation fuel, Disturbance to snow cover – caused by plane on landing and taking off Number and duration of flights reduced to minimum possible. Pick up landing will take place on existing air strip in order to reduce disruption to pristine or fragile ground or vulnerable ground flora. Drop off landing to be on fast ice if possible to prevent any disruption to snow cover on land or any underlying flora. :- Disturbance to snow cover – caused by ski tracks, Disturbance to fauna – by smell, noise or physical presence of ski team Efforts will be made to avoid unnecessary noise while travelling and to reduce physical disturbance to ground cover by, for example, skiing in single file where possible. The route taken by the ski expedition will be restricted wherever possible to sea ice to avoid disturbance to snow cover on land. Extra care will be taken to minimise disturbance when travelling on snow on land – for example, by sticking to thick snow cover. :- Camp noise (particularly stoves and tent fabric) and people, Emissions – from fuel used in camping stoves, Waste Disposal Any unnecessary noise or disturbance to snow cover when camping will be avoided. Storage and preparation of food has been planned to reduce aroma as far as possible by, for example, using dehydrated meals prepared in sealed packaging. Food will not be discarded (deliberately or accidentally). Instead, waste will be sealed and carried with the expedition. Grey water will be reduced as much as possible and will be sufficiently buried if unavoidable. Human waste will be sufficiently buried. If camping on land care will be taken to minimise any impact to any flora by, for example, pitching tents on thick snow cover and finding appropriate locations for human waste.

Qanurittuq Ittunik Avatinga: Avatingalluanga

Pack ice in the Prince Gustav Adolf Sea is a mix of multiyear, second-year, and first-year ice types. Ice remains landfast for more than half the year, and summertime ice concentration is high (7–9 tenths). In a typical year, less than 20% of the old ice and 50% of the first-year ice melt. There are large interannual fluctuations in ice coverage and some suggestion of a decadal cycle. The average ice thickness in late winter is 3.4 m but subregional means reach 5.5 m. The pack is a mix of two populations, one consisting largely of multiyear ice imported from the zone of heavy ridging along the periphery of the Beaufort gyre and the other consisting of a mix of relatively undeformed first-year, second-year, and multiyear icetypes that grow and age within the sea. The drift of ice through the Prince Gustav Adolf Sea is controlled in the present climate by the formation of stable ice bridges across connecting channels. The drift is episodic.

Qanurittuq Ittunik Avatinga: Inuuhimayunut Avatinga

The Prince Gustav Adolf Sea is not proximate to any areas of special protection or designated environmental areas. It does not contain any habitats or migration routes that are protected or designated but wildlife and marine vegetation are present. The pack ice of the Prince Gustave Adolf Sea is both habitat and potential migration route so appropriate measures will be taken to minimise as much as possible any impact of our presence.

Qanurittuq Ittunik Avatinga: Inungit-maniliurutingit Avatinga

The Prince Gustav Adolf Sea is a remote area that receives little human traffic and is approx 500km from the nearest communities. Aside for the airstrip that will be used for our extraction at Isachsen there is very little socioeconomic factors.

Miscellaneous Project Information

None added
