KEY MITIGATION

- Noise will attenuate to 45 db by 500 m, which will not disturb animals (see Noise to right).
- The wind towers will be shut down when groups of caribou approach during sensitive seasons.
- Behavioural and avoidance monitoring will determine if caribou are bothered by the wind tower and allow for adaptive management.
- The wind towers will be shut down during peak bird migration, at night during fog – research worldwide has shown that this combination of conditions can be dangerous for birds around wind towers.
- Monitoring will look for bird mortalities due to the wind towers and allow for adaptive management.

BENEFITS

Reduction of up to
~700 fuel truck trips
per year

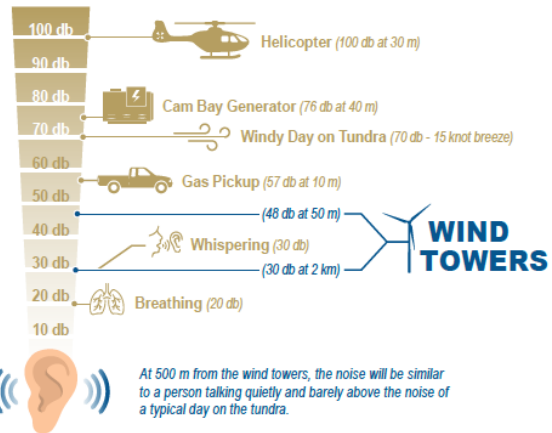

Reduction of
~15% sealifts
per year

~50% less fuel per year
~50% less greenhouse gas emissions

NOISE

Sabina conducted noise modeling to determine how loud the wind towers will be at various distances. Noise is measured in decibels (db) which is a logarithmic scale. That means the noise you hear doubles with every 7 db.
